

13 Coastal Infrastructure

13.1 Scenarios

- Climate change affects coastal infrastructure through rising mean and extreme sea levels, causing damages through temporary flooding and losses due to permanent submergence of land. To assess these impacts, climate scenarios have to be complemented by sea-level-rise projections. While the information about thermal expansion and dynamical changes of sea level is provided by the four GCMs considered, contributions from mountain glaciers and ice sheets have to be added from other sources, which introduces a further dimension of uncertainty (see section 5). The uncertainty range introduced is substantial and a least on equal footing with the climate model and scenario uncertainty (e.g. Kopp et al. 2014). To reflect this aspect we include an additional scenario dimension in the scenario design for this sector and sample this by providing projections for the median and 5th and 95th percentiles of the contributions from ice sheets and mountain glaciers to sea-level rise. One aspect specific to the coastal-infrastructure sector is that impacts are extremely non-linear in and sensitive to adaptation. Impacts without adaptation are 2-3 orders of magnitudes higher than those with adaptation (Hinkel et al. 2014). This leads to the circumstance that the regions with the highest infrastructure damages under the scenarios without adaptation are actually the regions least vulnerable to sea-level rise, because it is highly cost-efficient and standard practise to protect those regions against sea-level rise. Scenarios including adaptation are therefore added to the protocol to provide projections of climate change risks including adaptation potentials.
- Those models that do not account for varying societal conditions (population, GDP, protection levels etc.) should keep these fixed at year 2005 levels throughout the simulations (**2005soc** scenario in Group 1 (dashed line in Figure 1 a) + **rcp26soc** or **rcp60soc** scenario in Group 2). They only need to run the first pre-industrial period of Experiment I (1661-1860). Group 3 runs only refer to models that are able to represent future changes in societal conditions.

Climate & CO ₂ scenarios	
picontrol	Pre-industrial climate (year specific for the entire period 1661-2299).
historical	Historical climate and CO ₂ concentration.
rcp26	Future climate and CO ₂ concentration from RCP2.6.
rcp60	Future climate and CO ₂ concentration from RCP6.0.
rcp85	Future climate and CO ₂ concentration from RCP8.5.
Human influence & land-use scenarios	

1860soc	Pre-industrial society and protection.
2005soc	Representation of fixed year 2005 society and protection.
ssp2soc	Varying society and protection according to SSP2.
2100ssp2soc	Representation of fixed year 2100 society and protection according to SSP2.

Table 29 ISIMIP2b scenario specification for the simulations of impacts on coastal infrastructure.

Experiment		Input	Pre-industrial 1661-1860	Historical 1861-2005	Future 2006-2099	Extended future 2100-2299
I	no climate change, pre-industrial CO ₂	Climate & CO ₂	picontrol	picontrol	picontrol	picontrol
	varying society & protection up to 2005, then fixed at 2005 levels thereafter	Human & LU	Option 1: 1860soc	Option 1: histsoc	2005soc	2005soc
			Option 2*: 2005soc	Option 2*: 2005soc		
II	RCP2.6 climate & CO ₂	Climate & CO ₂	Experiment I	historical	rcp26	rcp26
	varying society & protection up to 2005, then fixed at 2005 levels thereafter	Human & LU		Option 1*: histsoc	2005soc	2005soc
				Option 2*: 2005soc		
III	RCP6.0 climate & CO ₂	Climate & CO ₂	Experiment I	Experiment II	rcp60	not simulated
	varying society & protection up to 2005, then fixed at 2005 levels thereafter	Human & LU			2005soc	
IV	no climate change, pre-industrial CO ₂	Climate & CO ₂	Experiment I	Experiment I	picontrol	picontrol

	varying society & protection up to 2100 (SSP2), then fixed at 2100 levels thereafter	Human & LU			ssp2soc	2100ssp2soc
VI	RCP2.6 climate & CO ₂	Climate & CO ₂	Experiment I	Experiment II	rcp26	rcp26
	varying society & protection up to 2100 (SSP2), then fixed at 2100 levels thereafter	Human & LU			ssp2soc	2100ssp2soc
VII	RCP6.0 climate & CO ₂	Climate & CO ₂	Experiment I	Experiment II	rcp60	not simulated
	varying society & protection (SSP2)	Human & LU			ssp2soc	
VIII	RCP8.5 climate & CO ₂	Climate & CO ₂	Experiment I	Experiment II	rcp85	not simulated
	varying society & protection up to 2005, then fixed at 2005 levels thereafter	Human & LU			2005soc	
IX	Optional: RCP6.0 climate & CO ₂ with improved bias-correction and statistical downscaling of climate variables (ewembi-improved)	Climate & CO ₂	picontrol	historical	rcp60	not simulated
	society & protection fixed at 2005 levels	Human & LU	1860soc	histsoc	2005soc	

13.2 Output data

Table 30 Variables to be reported by coastal infrastructure models.

Variable (long name)	Variable name	Unit (NetCDF format)	Resolution	Comments
Expected number of people flooded annually	par	thousands/yr (1000 yr-1)	Time resolved grid	Par = People at risk.
Expected seafood costs	seafloodcost	million dollars/yr (mio 2005US\$ yr-1)		Expected annual damage caused by seafoods
Adaptation costs of building and upgrading dikes	seadikecost	million dollars/yr (mio 2005US\$ yr-1)		Cost for building/upgrading dikes
Adaptation costs of maintaining dikes	seadikemain	million dollars/yr (mio 2005US\$ yr-1)		Cost for maintenance of dikes build since the initial year (2000), but not cost for dikes “build” in the initialization of the model.
