

## Human impacts on water scarcity in the 20<sup>th</sup> century

*A multi-model and multi-forcing analysis*

# Increasing pressures on World's water resources

# Call for increasing levels of management and use of water

# Research questions

**What is the impact of time-varying LULCC and human interventions on water resources and water scarcity conditions in the 20th century at a sub-annual scale?**

- What is the change in exposure to water scarcity?
- Do LULCC and human interventions influence the seasonality of water scarcity?
- How do other characteristics of water scarcity change: persistence, recurrence?
- What is the source of change: local, local sub-basin, upstream sub-basin

# Methods & Data

- Evaluated monthly WA and WS under pristine and transient conditions (1971-2010)
- Water Scarcity Index =  $[ WW / (WA-EF) ]$       WS if WSI > 1
- Monthly variable environmental flow requirements (Pastor 2014)
- Dynamic HYDE 3.1 - MIRCA dataset to cover LULCC
- ISI-MIP 2.1a global water data :
  - 5 impact models: H08, LPJmL, MATSIRO, PCR-GLOBWB, WaterGAP
  - 3 forcing data-sets: GSWP3, WFDEI, Princeton
- Ensemble-statistics: interquartile-range, ensemble-mean, ensemble-median

## Results

# Exposure to water scarcity – pattern of change WA

— Decreasing availability of water resources (Ens-Mean)  
 — Increasing availability of water resources (Ens-Mean)

— Decreasing availability of water resources (Inter-Quart. range)  
 — Increasing availability of water resources (Inter-Quart. range)

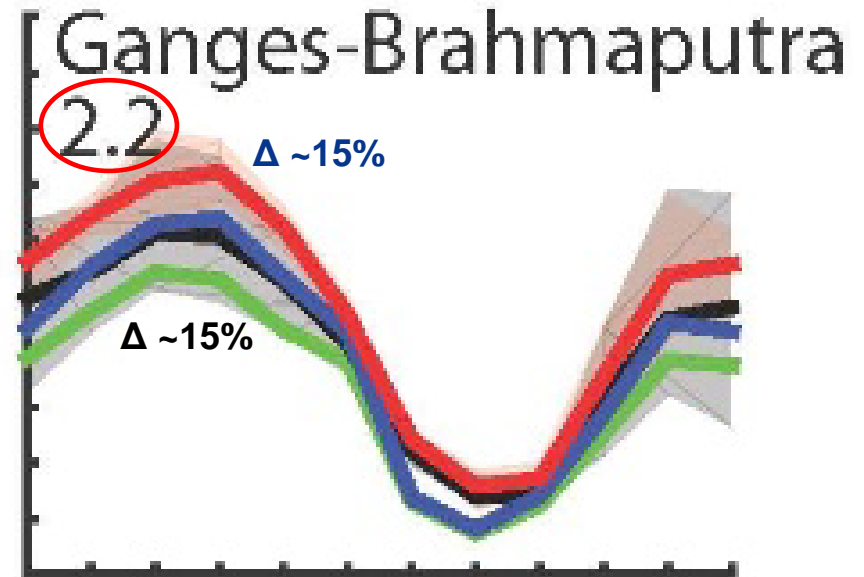

# Exposure to water scarcity – pattern of change WS

— Movement into/Increasing severity of water scarcity (Ens-Mean) — Movement into/Increasing severity of water scarcity (Inter-Quart. range)  
— Movement out/Decreasing severity of water scarcity (Ens-Mean) — Movement out/Decreasing severity of water scarcity (Inter-Quart. range)

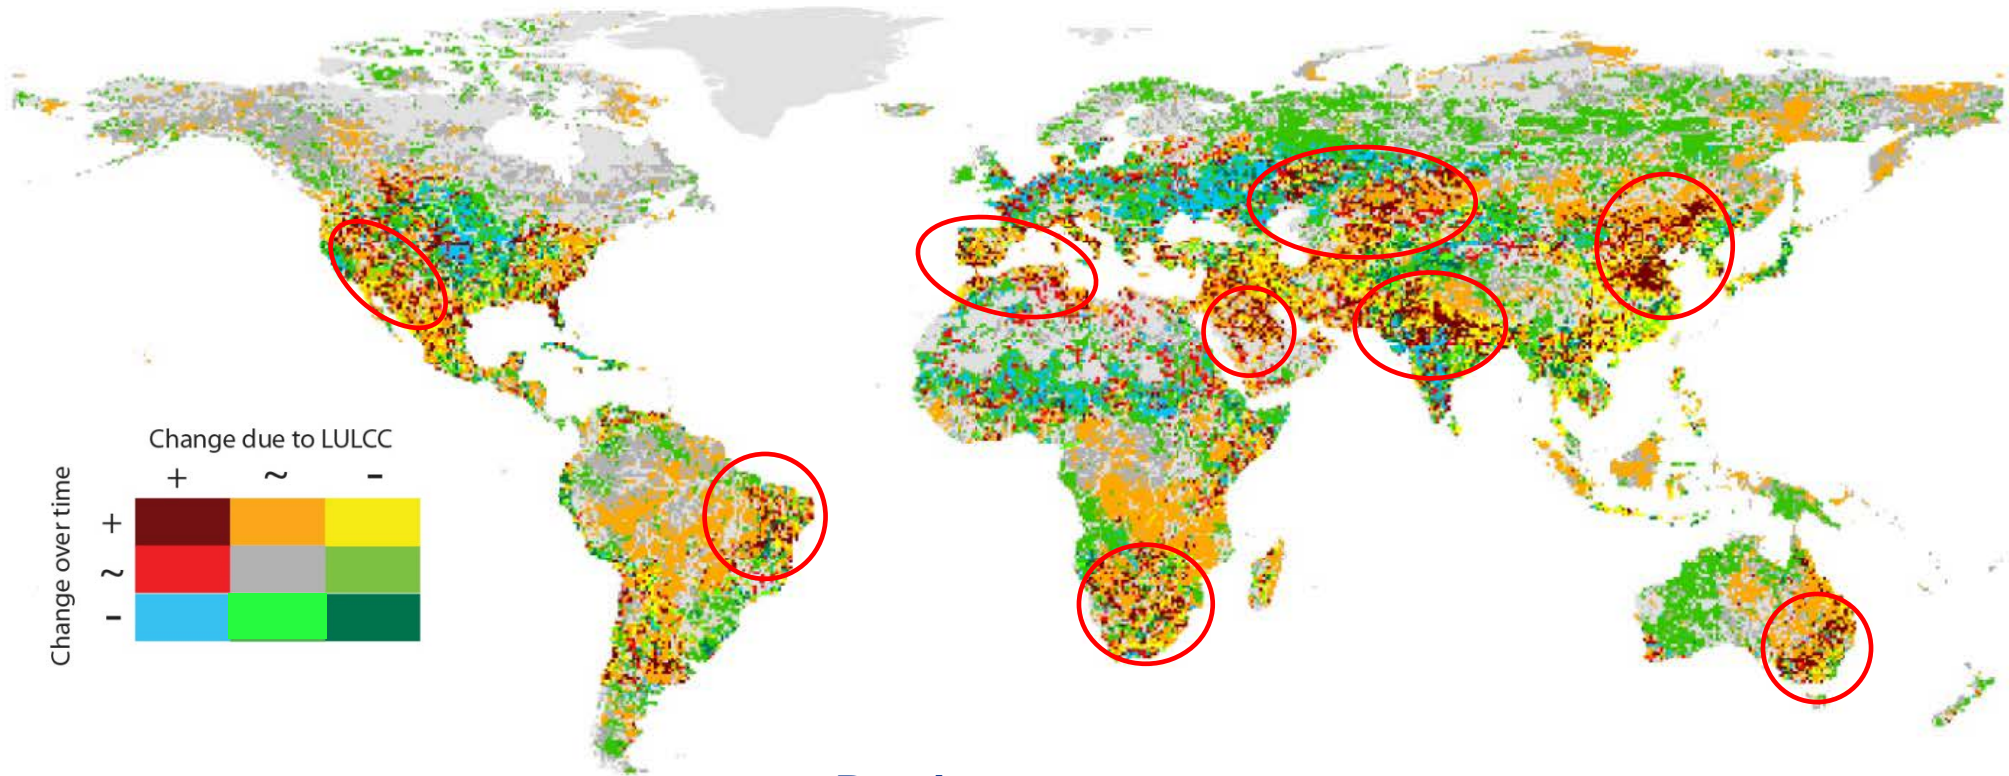

# Exposure to water scarcity – net change

— Pristine cond. 1991-2010 (Ens-Mean)    — Pristine cond. 1971-1990 (Ens-Mean)    — Pristine cond. 1991-2010 (Inter-Quart. range)

— Transient cond. 1991-2010 (Ens-Mean)    — Transient cond. 1971-1990 (Ens-Mean)    — Transient cond. 1991-2010 (Inter-Quart. range)

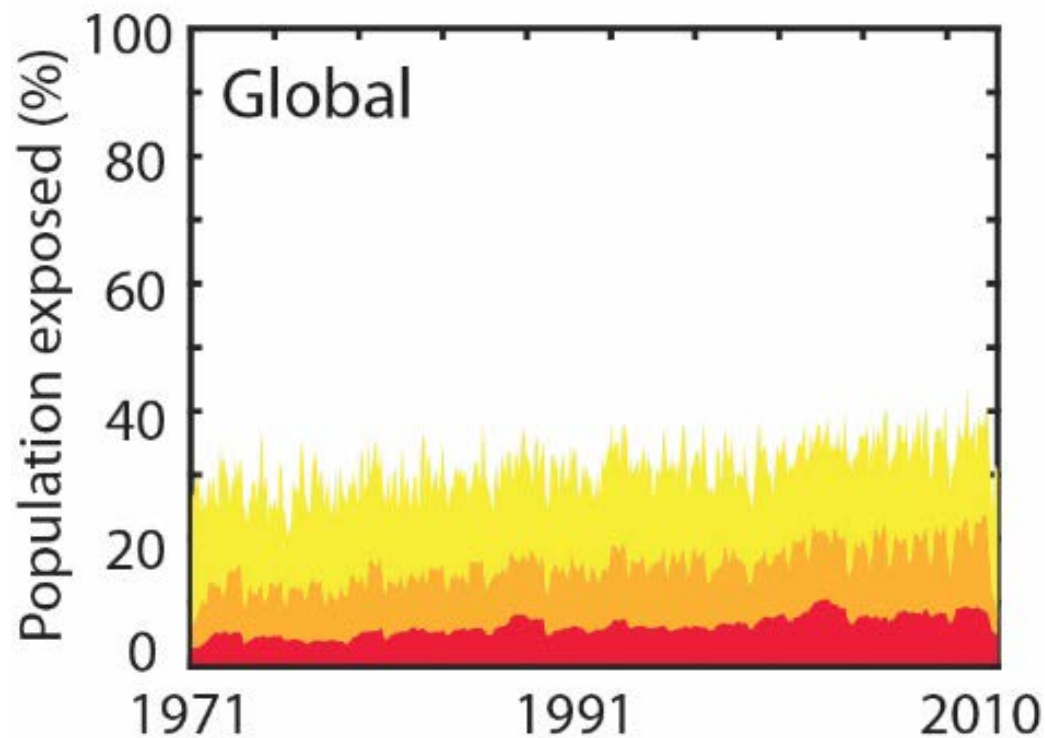

# Persistence and recurrence of water scarcity events

## Persistence

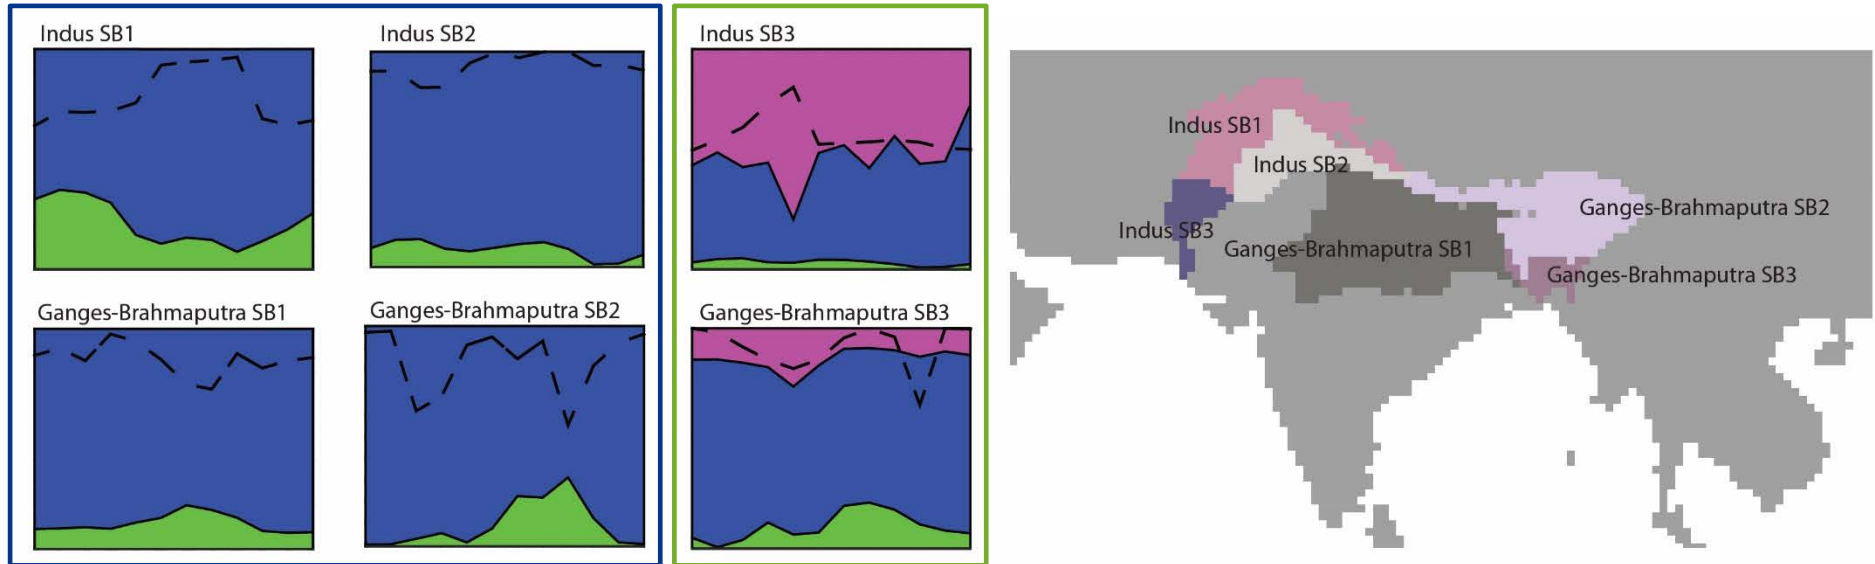

# months / # events

# Duration of water scarcity events

Short duration events (< 6m)    Medium duration events (6-12m)    Long duration events (> 12m)

# Drivers of change

- Local runoff as largest contributor of increasing water scarcity
- Incoming discharge local sub-basin as largest contributor of increasing water scarcity
- Incoming discharge upstream sub-basin as largest contributor of increasing water scarcity
- - - Local runoff as largest contributor of decreasing water scarcity

# Take home messages

## Impacts LULCC & human interventions on water scarcity via a MM framework

- Sub-annual level, minimum environmental flow requirements, multi-model framework

## Exposure:

- Higher than yearly estimates, lower than monthly estimates (seasonal approach)
- Significant share of population affected by change in WA and WS
- Net effects minor – especially globally

## Seasonality:

- Explicit regional patterns
- Clear impacts of human interventions – especially during ‘high exp.’ seasons
- No seasonal shifts in exposure

# Take home messages

## Persistence:

- Significant regional variations – persistence & change in persistence
- Significant land area with increasing persistence over time/human interventions
- Increasing exposure to medium/long WS events
- Different WS events illustrative for variability: seasonal, annual, decadal

## Drivers of change:

- Increasing WA/Decreasing WS: local runoff
- Decreasing WA/Increasing WS: incoming discharge (local/upstream sub-basins)

→ Need for IRWM in coping with socioeconomic pressures on water resources
