OPEN

Climate signals in river flood damages emerge under sound regional disaggregation

Inga J. Sauer ^{1,2}, Ronja Reese ¹, Christian Otto ¹ , Tobias Geiger ^{1,3}, Sven N. Willner ¹, Benoit P. Guillod ^{2,4}, David N. Bresch ^{2,5} & Katja Frieler ¹ 

Motivation - evaluate ISIMIP3a GHMs to inform ...

1.) ... flood modelling

- Is peak discharge overestimated?
- how well is inter-annual variability of peak discharge simulated?

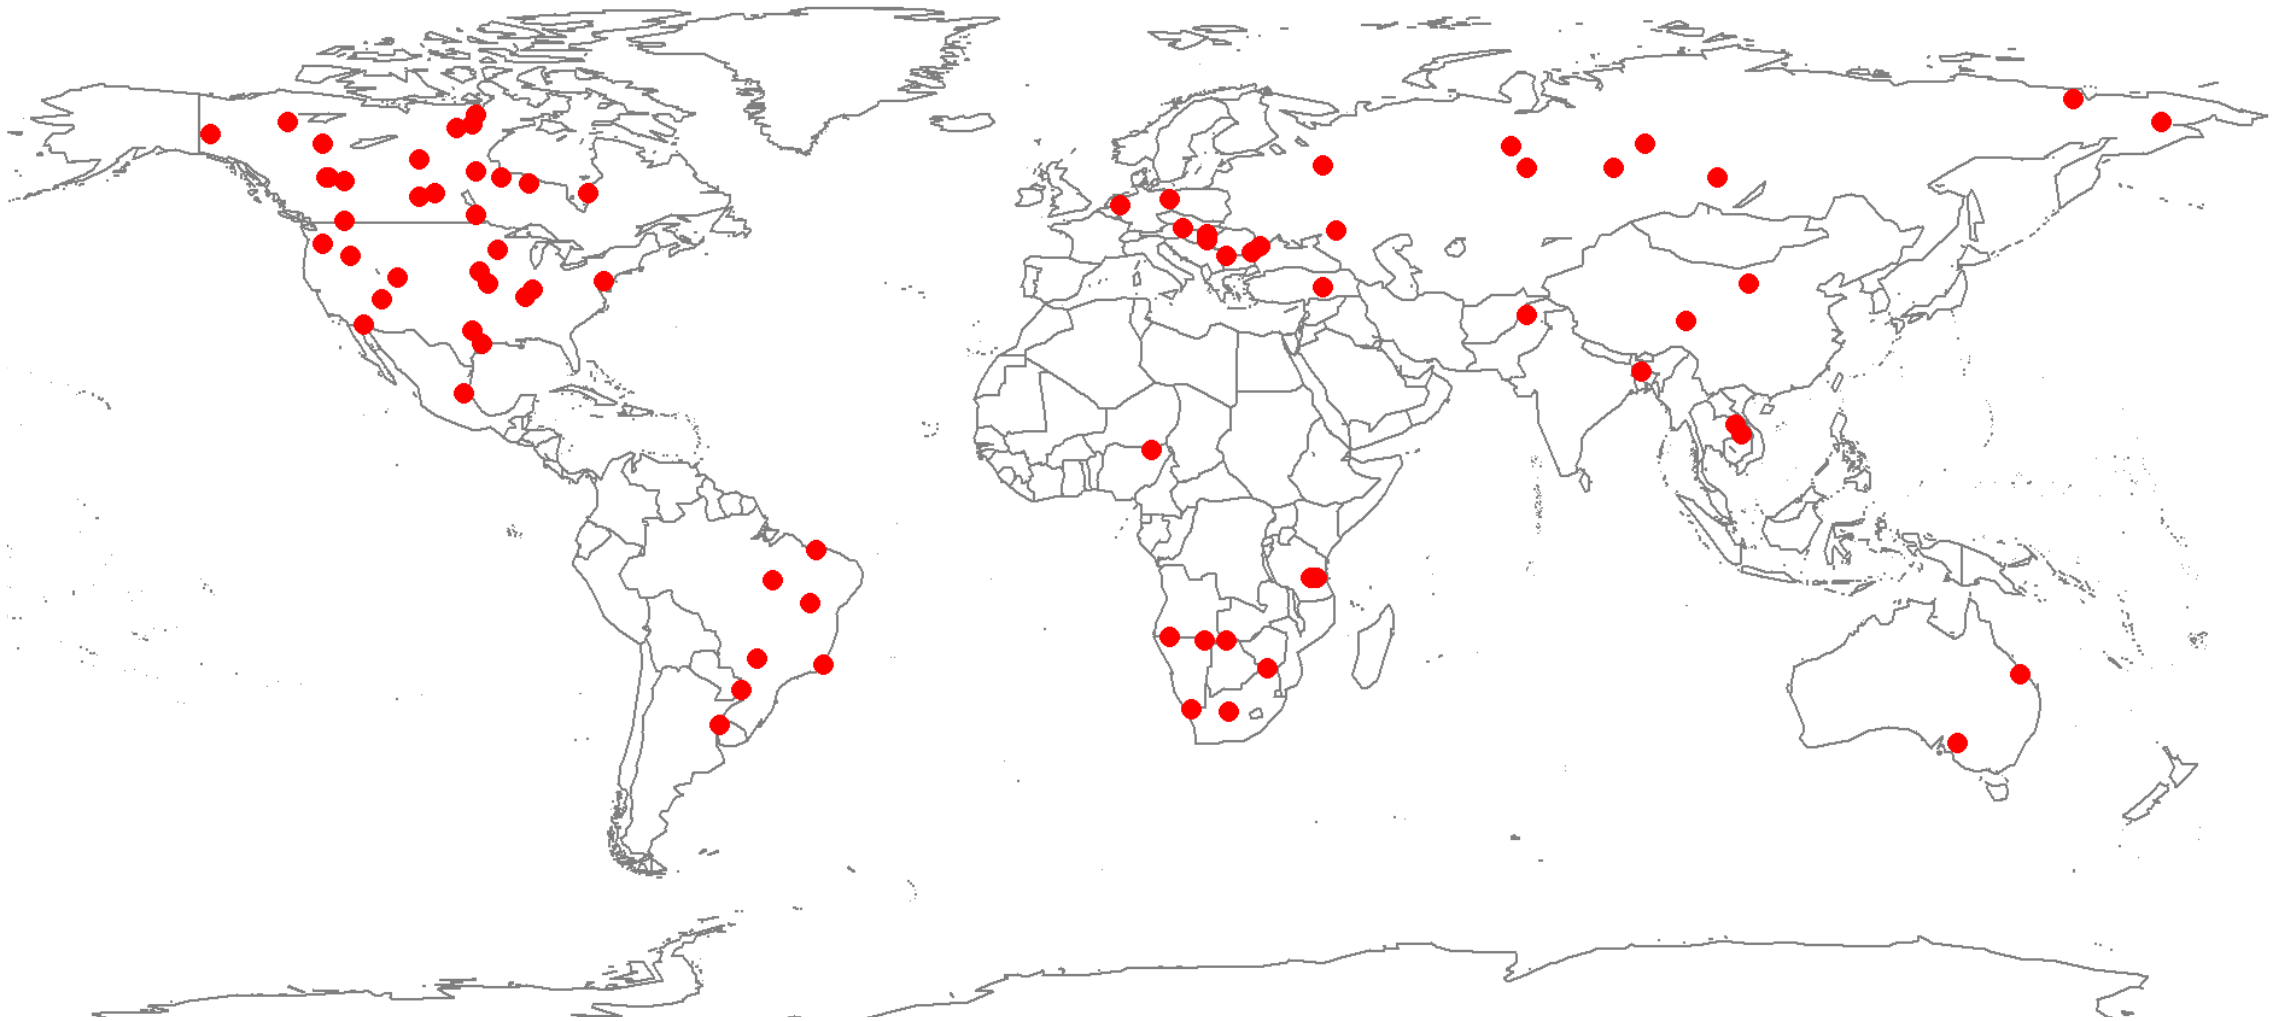

2.) ... attribution studies

- at which stations are models performing well?
- and why?

Approach

- **variable: discharge**
- **9 GHMs from ISIMIP3a**
 - **discharge with model's internal routing scheme**
 - **runoff modelled by GHMs to drive CaMa-Flood -> discharge**
- **Observational data**
 - **from GRDC (Global Runoff Data Centre)**
 - **74 stations**
 - **shown to be compatible with GHMs' routing scheme (Schmied & Schiebener, 2022)**

Approach

Approach

- **daily + maximum annual discharge**
- **evaluation metrics**
 - **correlation (r)**
 - **over/underestimation (percent bias in %)**

Result - daily discharge

Next steps:

- **derive additional station parameters**
 - aridity index, elevation/slope, management
- **identify stations for which models are performing best + why?**
- **quantify the distribution of peak discharge**
- **investigate possibility for bias adjustment**
