# Context

---

# Context – Coastal eutrophication

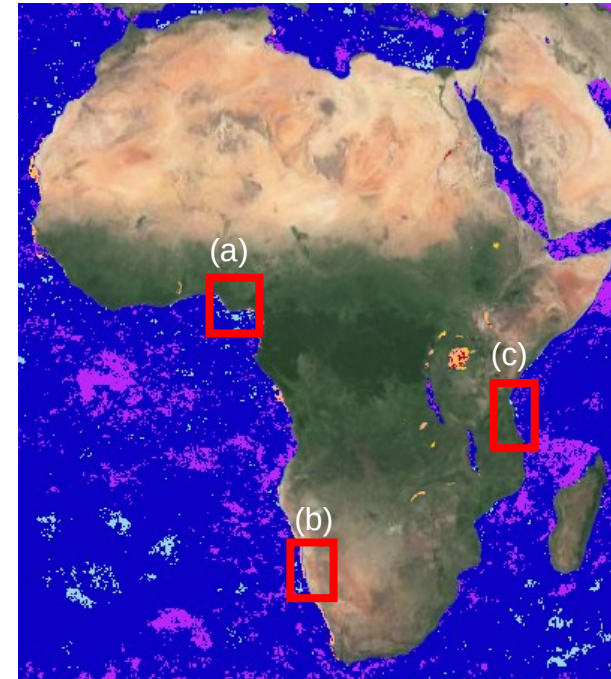

**Eutrophication** is a global issue associated with increasing anthropogenic **nutrient loading**

Globally, coastal waters covering ~1.15 million km<sup>2</sup> are eutrophic potential.

(Maúre et al., 2021; Nat. comms)

> 20 occurrences of eutrophication in African coastal waters (Selman et al. 2008)

## Global Eutrophication Watch – (Extract)

Eutrophication Potential

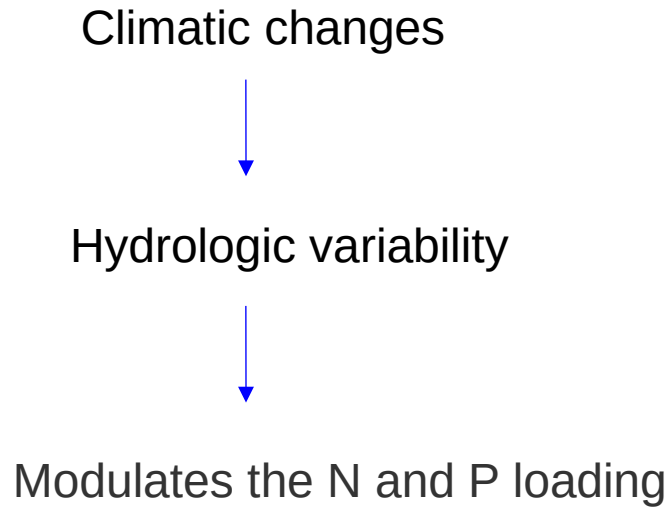

(Maúre et al., 2021; Nat. comms)

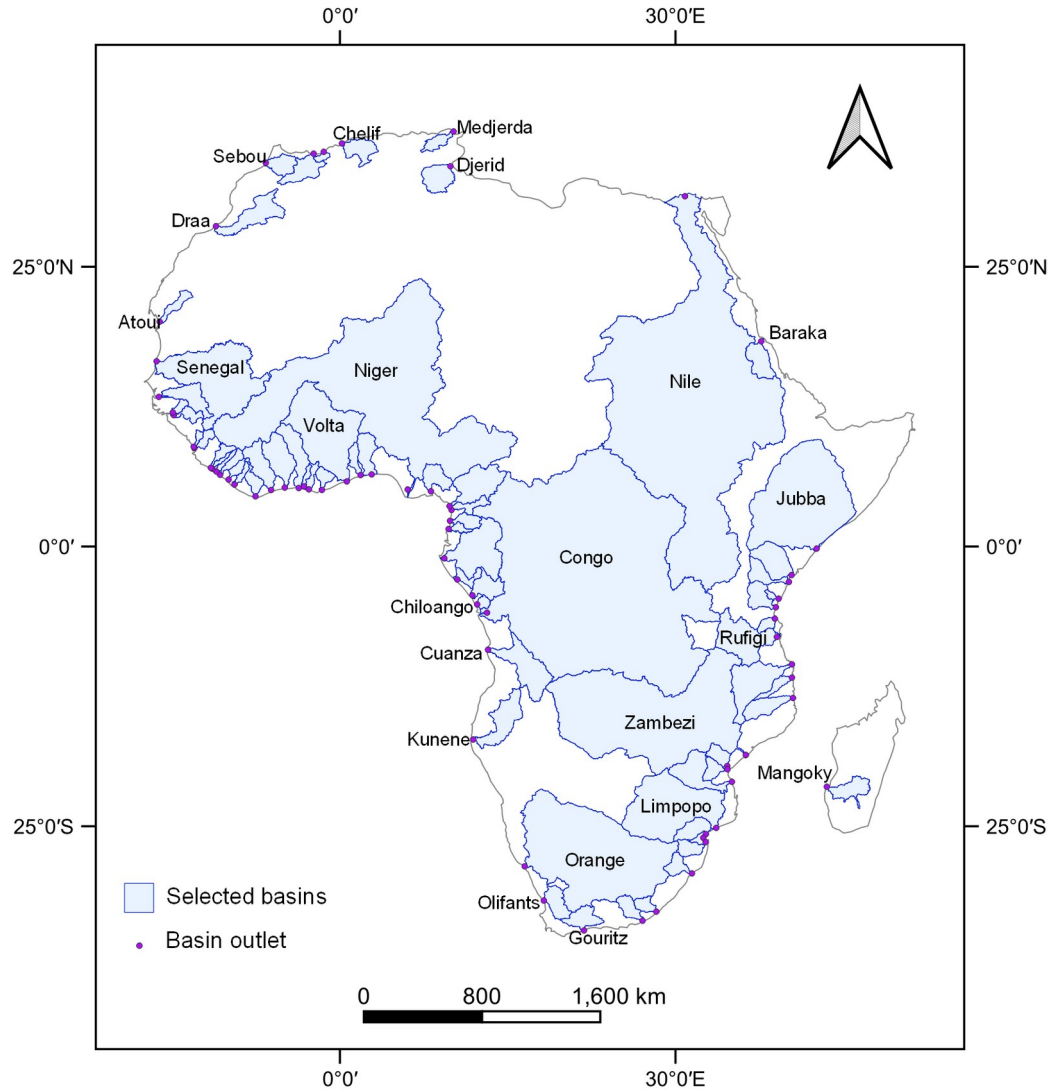

# Context – Taking account of climate change

Interplay of Land-use, Socio-economic & **Meteorological forcing**

## Link between climate change and riverine nutrient export

# Study Focus – Africa

Studies on riverine nutrient export to African coastal waters are **scarce** (*Yasin et al., 2010*)

Linkages between climate & nutrient export by rivers to coastal waters has not been explored

**No long time series available**

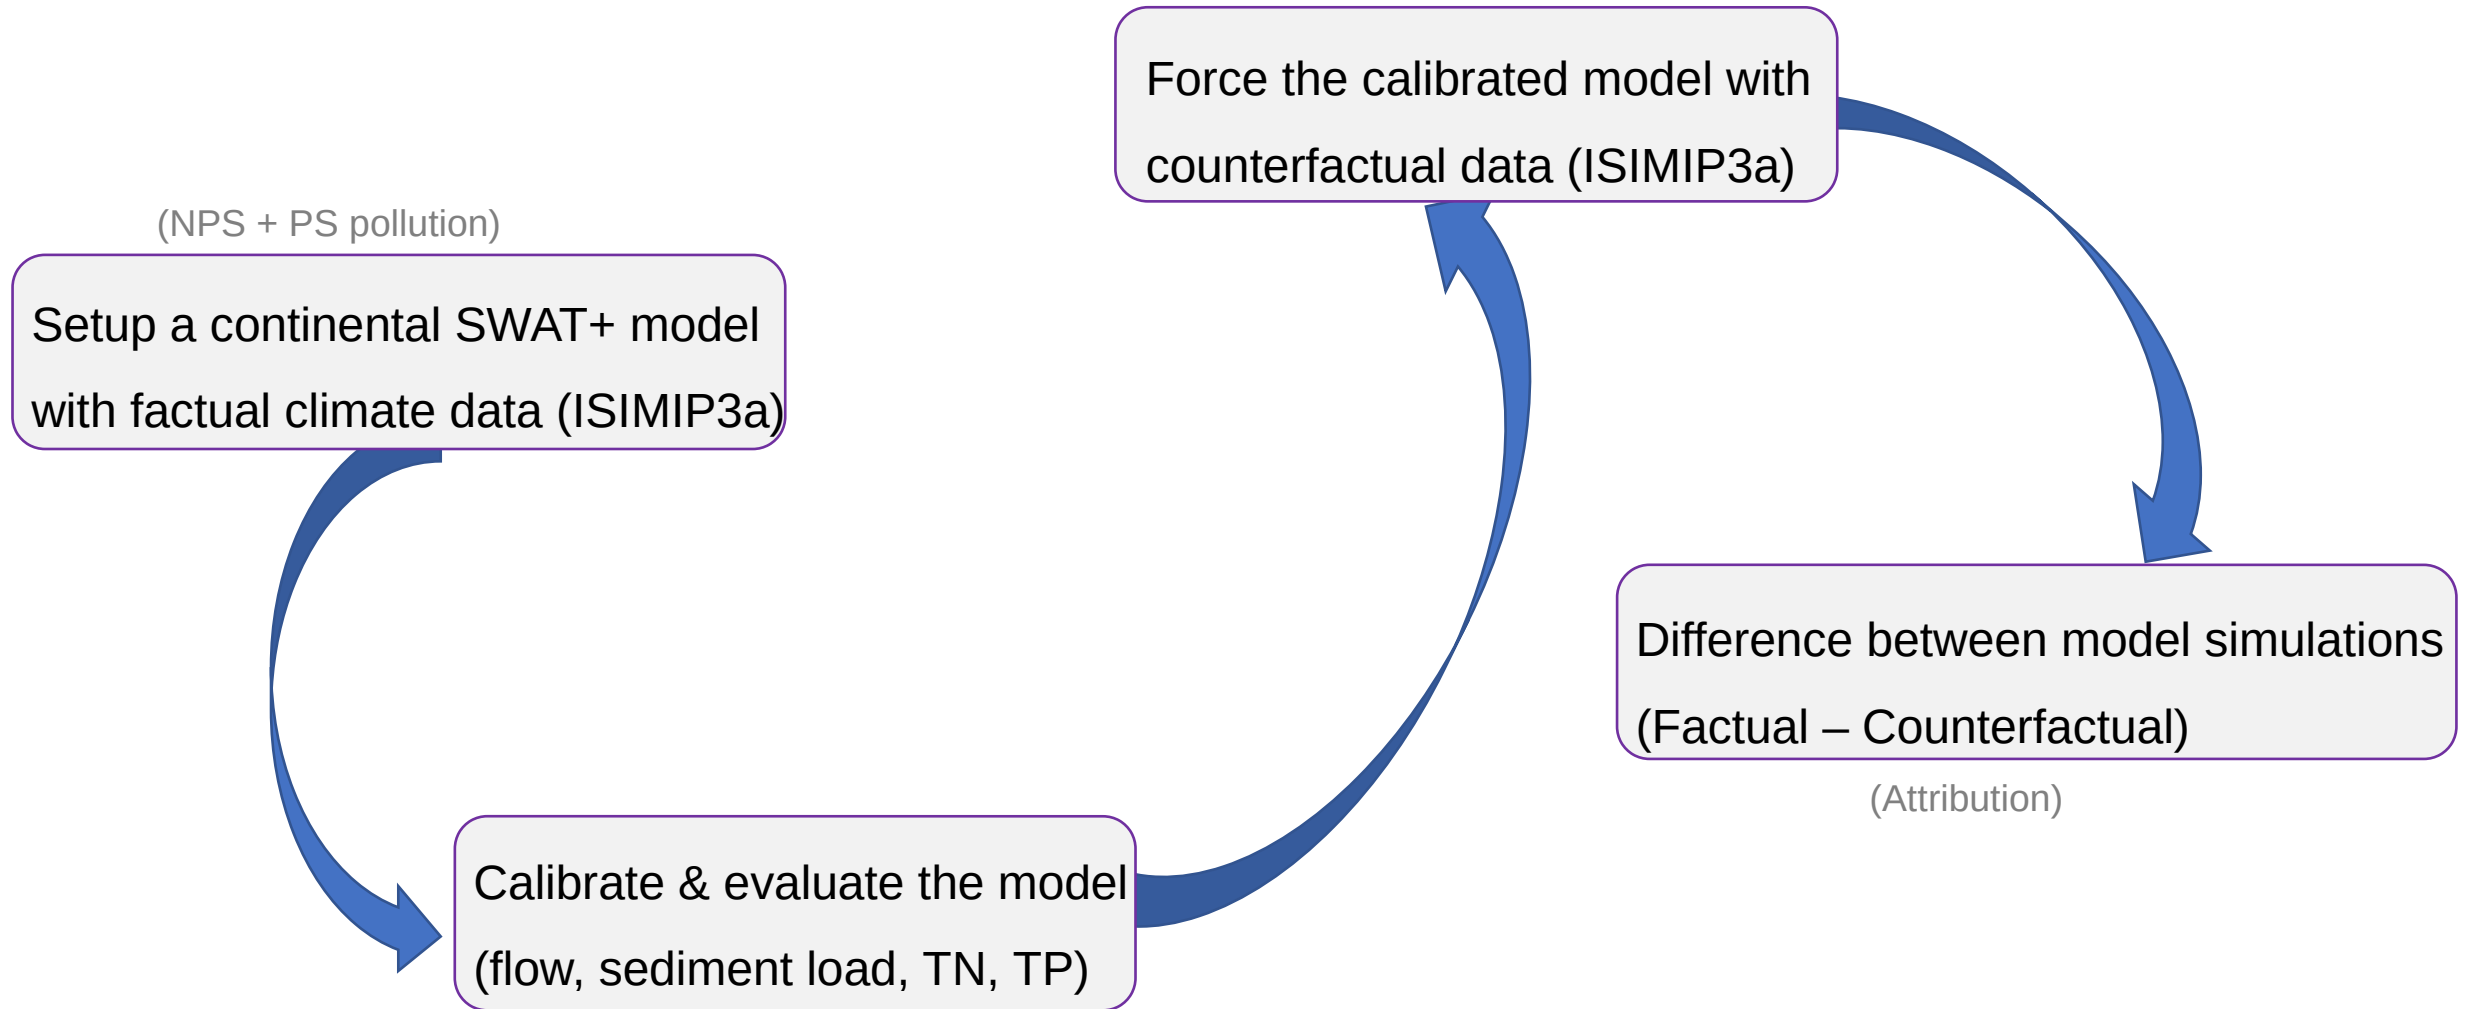

- Focus on 70 major exorheic basins
- Basin sizes ranging: 3.7 million km<sup>2</sup> to 6700 km<sup>2</sup>
- Total Nitrogen (TN) & Total Phosphorus (TP)

# Approach

---

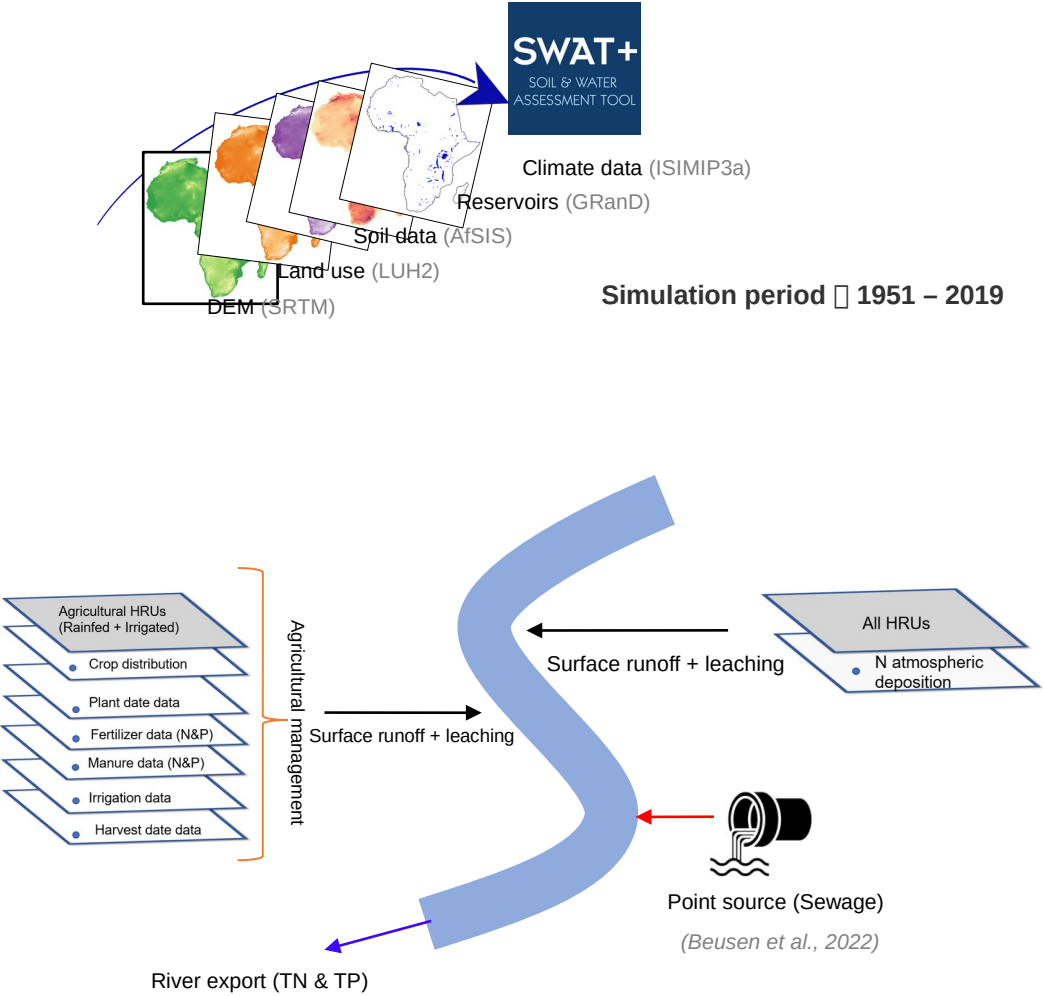

# Modeling Approach

---

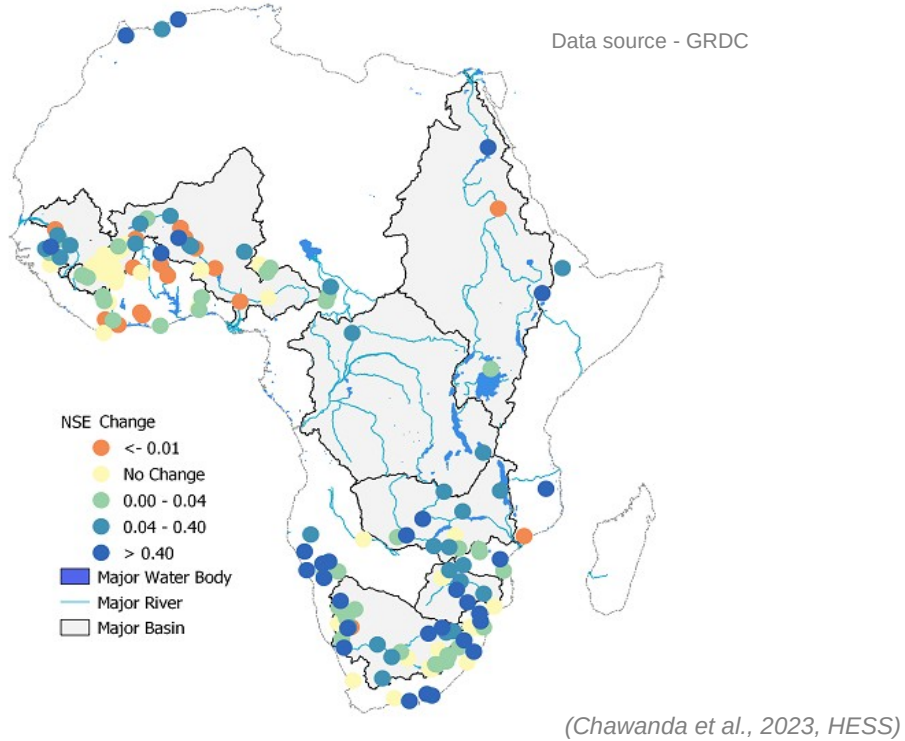

# Model setup & Evaluation

(a) Set up

(b) Hydrological evaluation

Hydrology and Earth System Sciences Discussions  
 EGU

**Combined impacts of climate and land-use change on future water resources in Africa**

Celray James Chawanda<sup>1</sup>, Albert Nkwasa<sup>1</sup>, Wim Thiery<sup>1</sup>, Ann van Griensven<sup>1,2</sup>

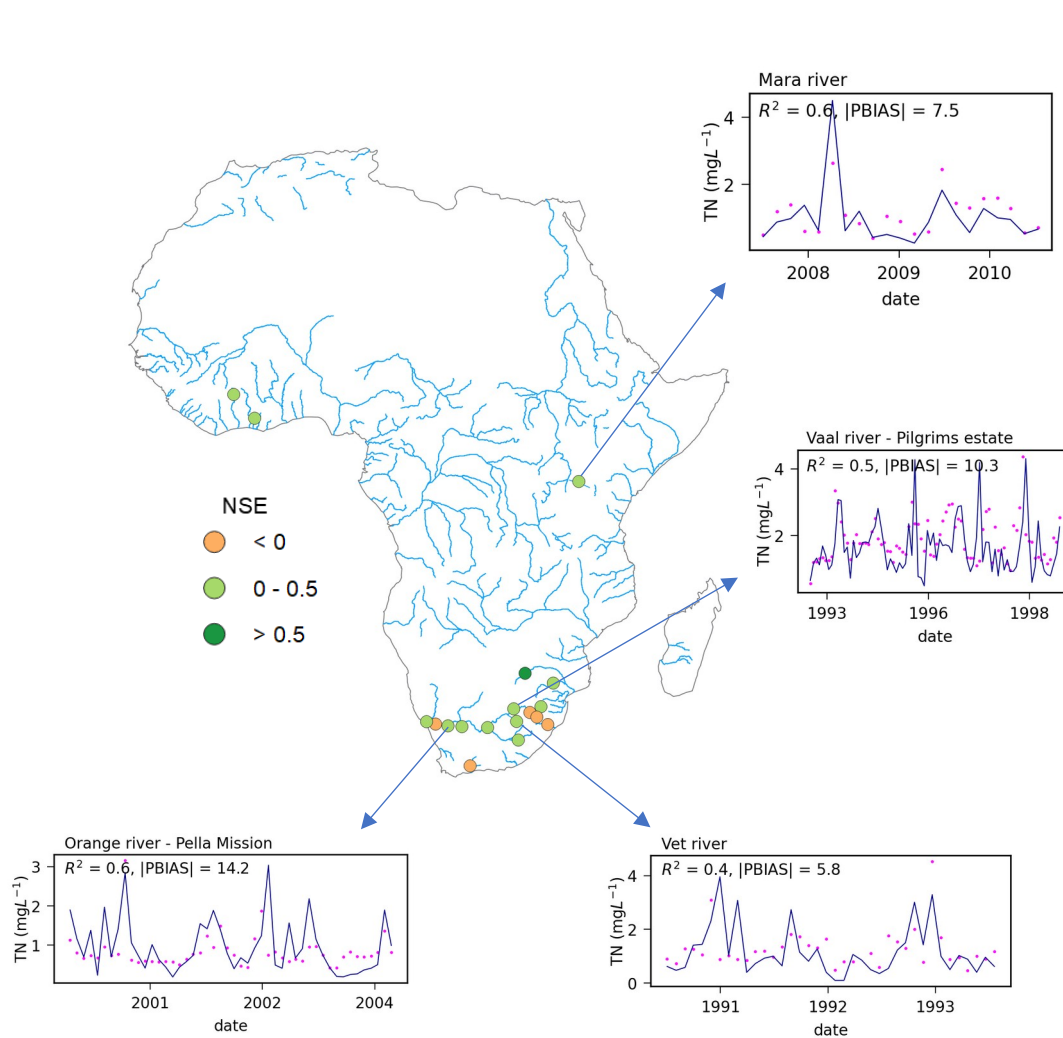

<sup>1</sup>Department of Hydrology and Hydraulic Engineering, Vrije Universiteit Brussel, 1050 Brussels, Belgium.  
<sup>2</sup>IHE-Delft Institute for Water Education

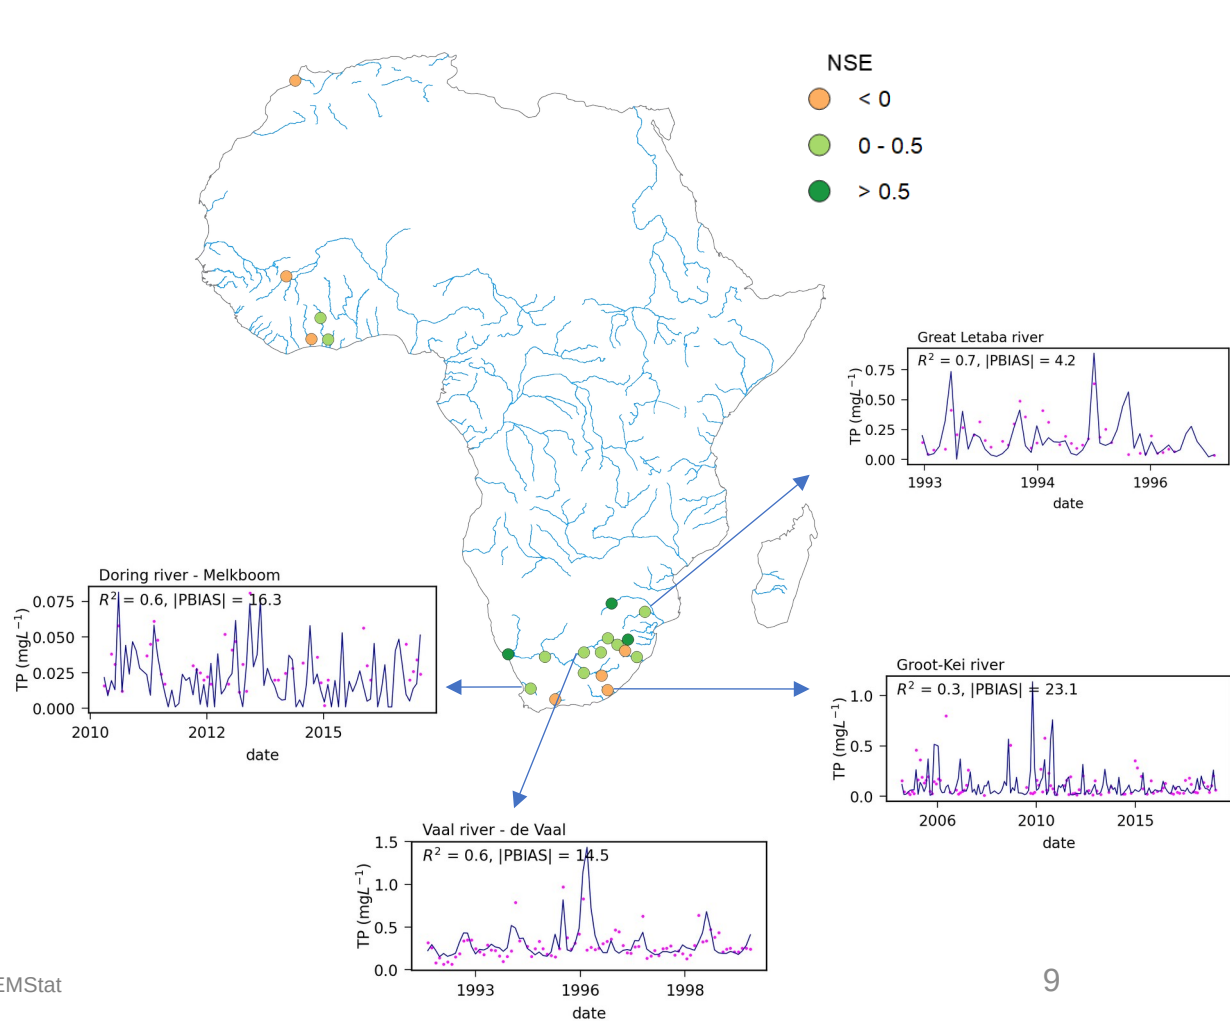

# Model setup & Evaluation

(a) Total Nitrogen (TN)

(b) Total Phosphorus (TP)

• observed TP  
— simulated TP

**NSE**  
• < 0  
• 0 - 0.5  
• > 0.5

# Results - Attribution

---

(Factual vs Counterfactual simulations)

# TN & TP attribution

## Long-term annual river load change

(a) TN

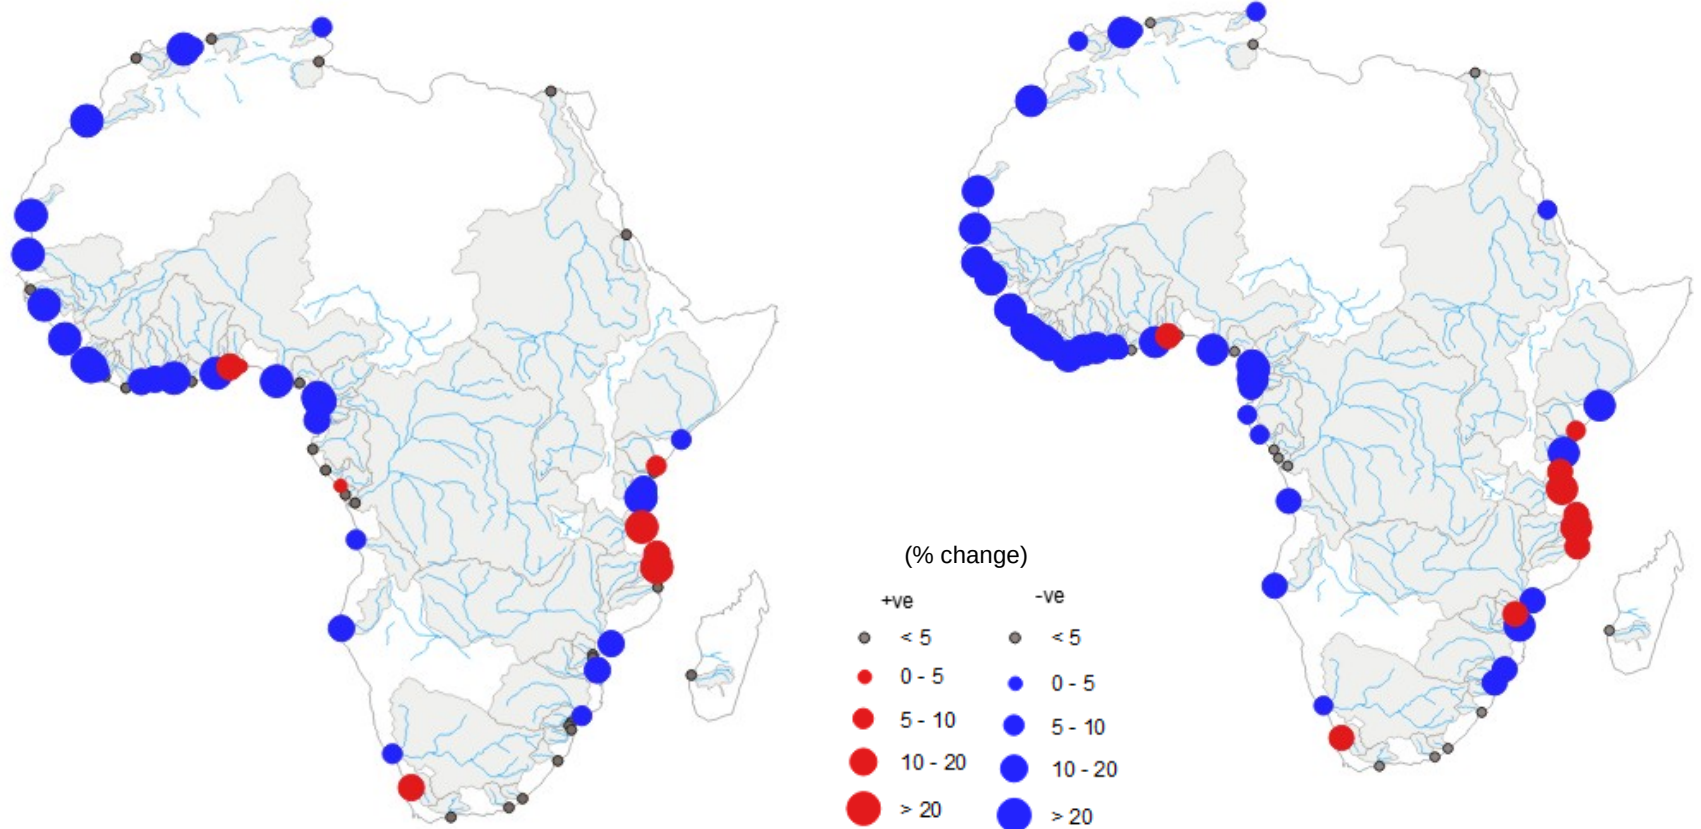

(b) TP

$$i = \left( \frac{S_c - S_o}{S_c} \right) \times 100$$

$S_o$  is the historical impact of climate change (%)

$S_c$  is the annual average model output of simulations forced with **counterfactual climate data**

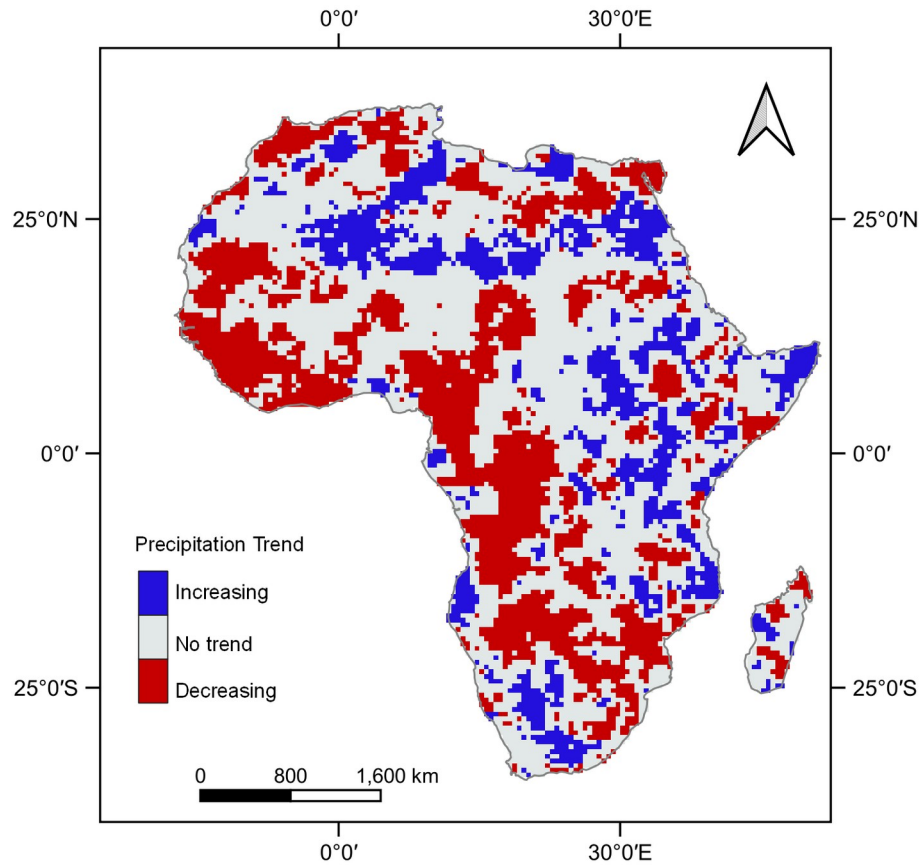

$S_o$  is the annual average model output of simulations forced with **factual climate data**

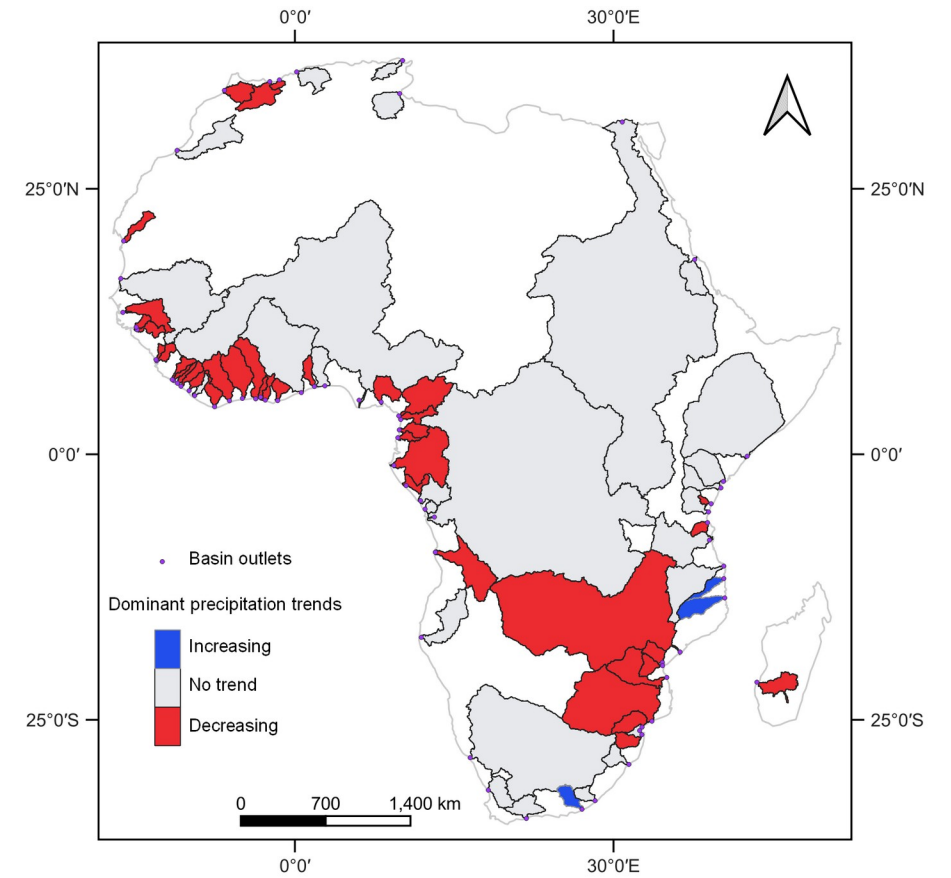

Climate change mostly contributing to a **decrease** in N & P export

# Trends - Precipitation

## Factual precipitation

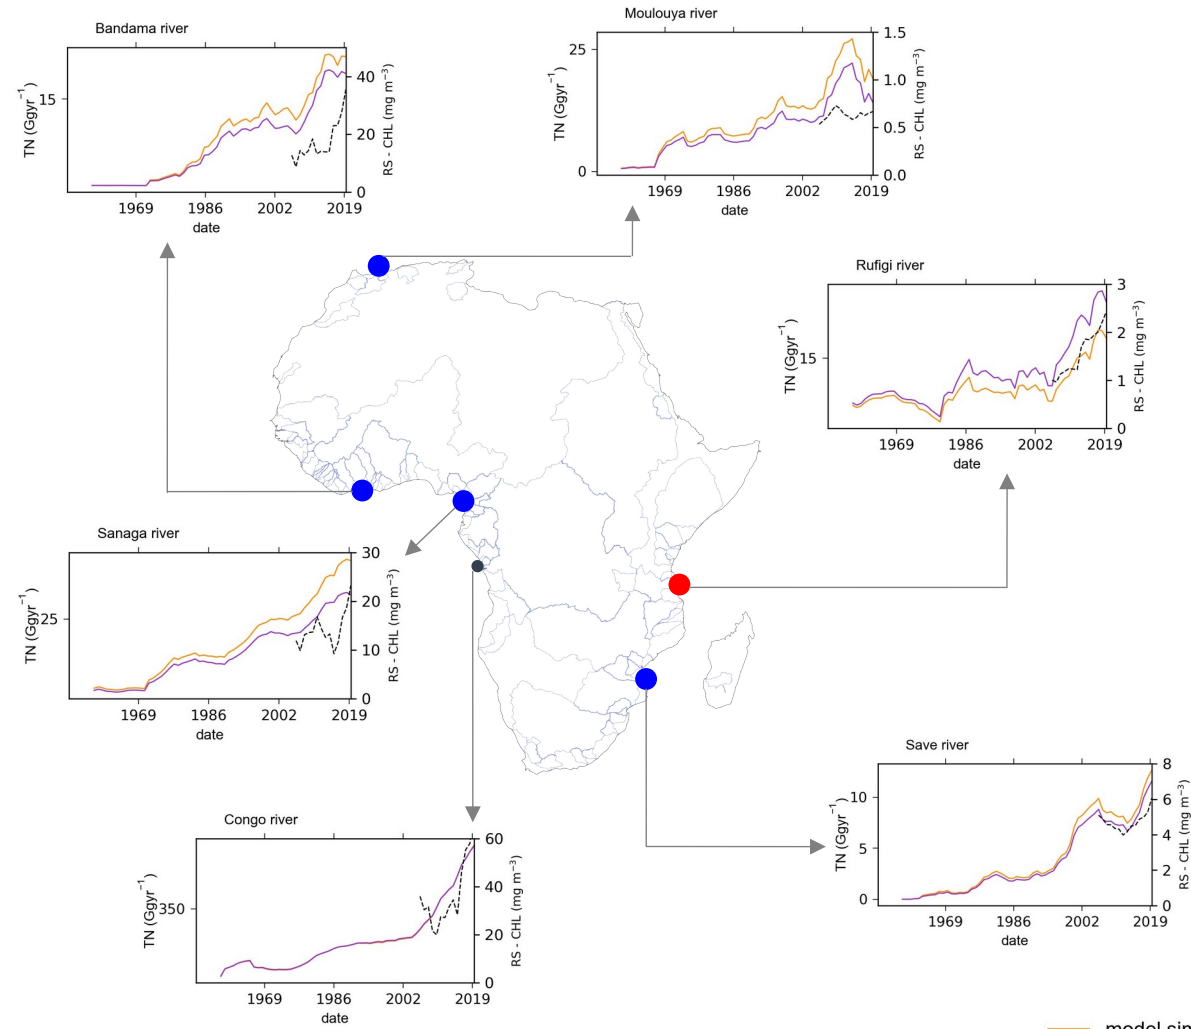

## Dominant trend in major basins

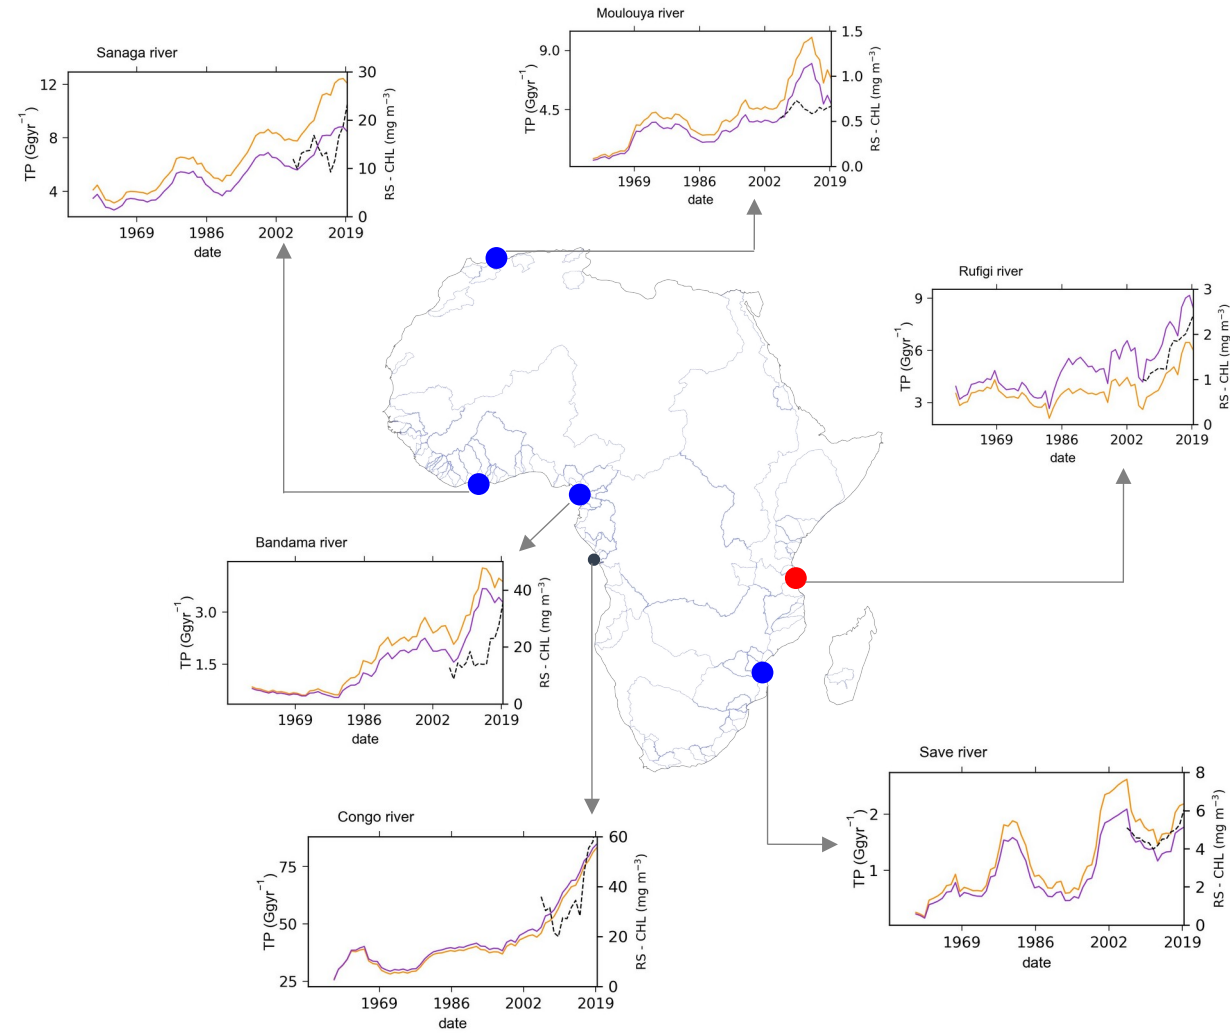

Historic precipitation patterns show that much of Africa is **drying** (Hartmann et al. [2013](#)).

# TN & TP attribution - Trends

(a) TN

(b) TP

- model simulations forced with counterfactual climate
- model simulations forced with factual climate
- - - Remote Sensing (RS) - Chlorophyll-a

## Preliminary Take away(s)

- CC signal on nutrient loads more apparent in small rivers (basin area < 420,000km<sup>2</sup>)
- The trends in nutrient loads cannot be explained by climate change
- CC has mostly contributed to a decrease in magnitude of nutrient loads to the ocean

## Next Step (s)

- Run simulations of Fixed vs Dynamic **Land use change** & Fixed vs Dynamic **Point sources**
- Compare River Loads vs River concentrations

Thank you!

## Extra slides

# Input Datasets

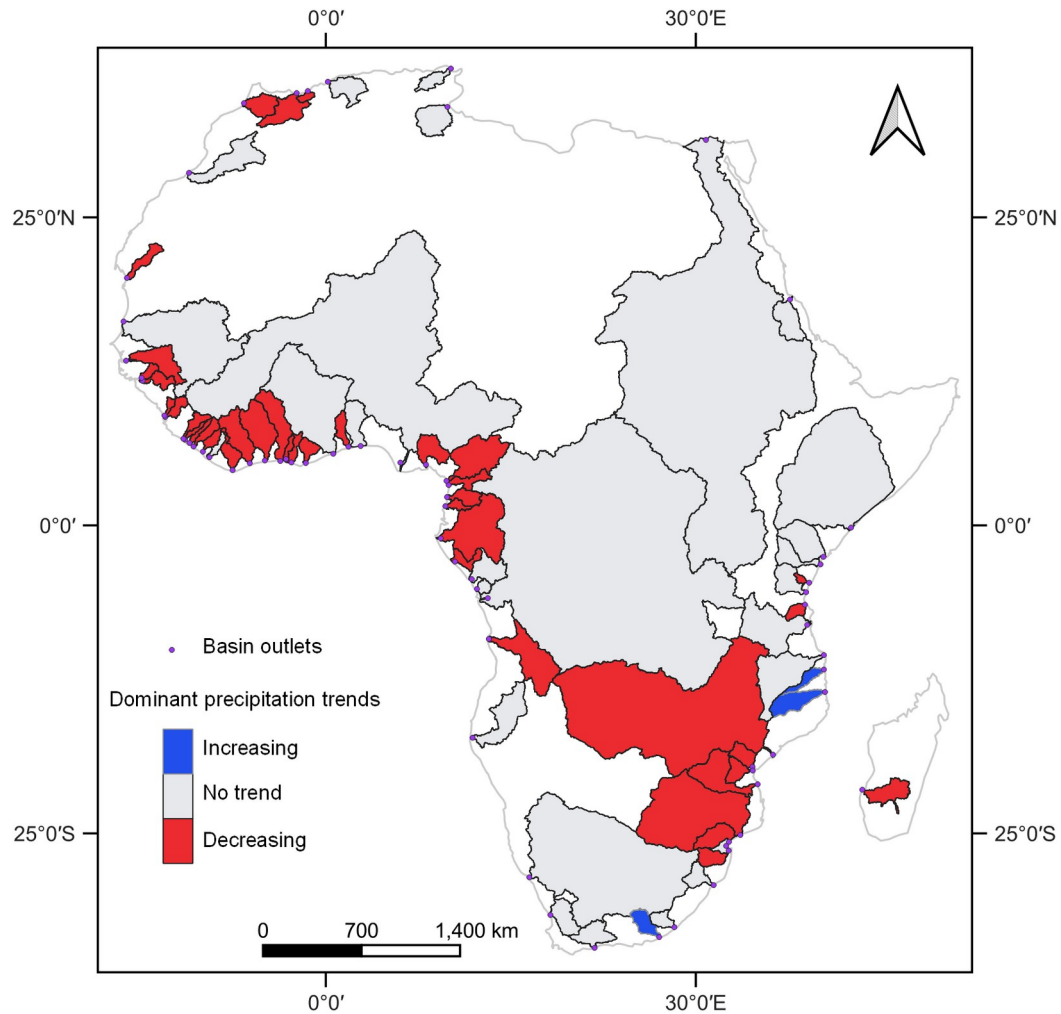

Global Datasets	Resolution	Source
Digital Elevation Model (DEM)	90m	Shutter Radar Topography Mission (SRTM; Farr et al., 2007)
Land use	0.25 °	Harmonized land use (LUH2; Hurtt et al., 2020)
Soil	250 m	Africa Soil information Service (AFSIS; Hengl et al., 2015)
Climate	0.5 °	ISIMIP (GSWP3-W5E5; Dirmeyer et al., 2006; Kim et al., 2017; Lange, 2019; Cucchi et al., 2020) (Factual & Counterfactual)
Irrigated areas	0.083 °	Food and Agriculture Organization (FAO; Siebert et al., 2013)
Plant and harvest dates	0.5 °	Global Gridded Crop Model Intercomparison (GGCMI; Jägermeyr et al., 2021)
Fertilizer – Nitrogen(N)	0.5 °	(Hurtt et al., 2020)
Fertilizer – Phosphorus(P)	0.5 °	(Lu and Tian, 2017)
Manure (N & P)	0.5 °	(Potter et al., 2010)
Point sources (N & P)	0.5 °	(Beusen et al., 2024)

## (b) Evaluation

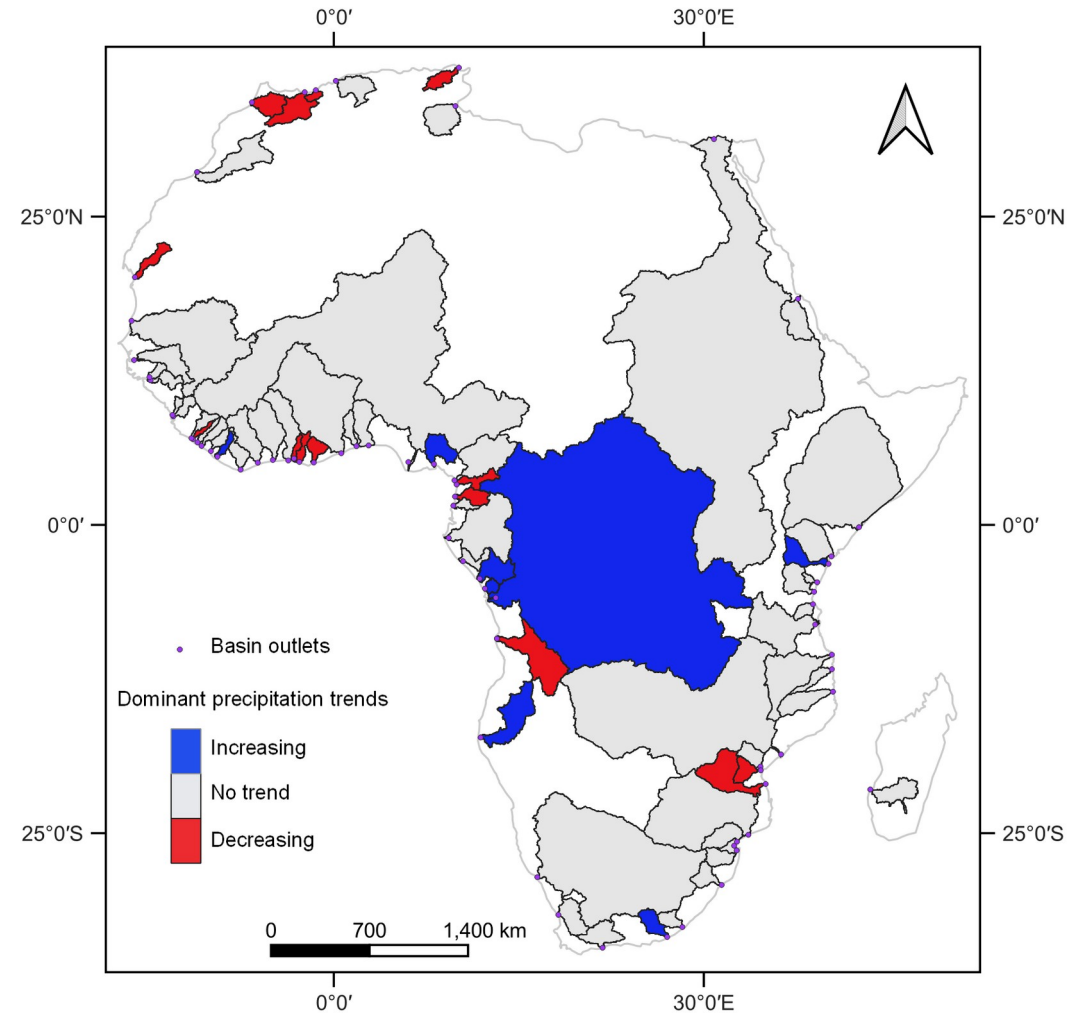

Dataset	Resolution	Source
Leaf Area Index (LAI)	1 km	CGLS ( <a href="https://land.copernicus.vgt.vito.be/">https://land.copernicus.vgt.vito.be/</a> )
Evapotranspiration (ET)	250 m	WaPOR (FAO, 2018)
River Discharge	monthly	GRDC ( <a href="http://grdc.bafg.de">http://grdc.bafg.de</a> )
River nutrients (N & P)	Daily & monthly	GEMstat ( <a href="https://gemstat.org/">https://gemstat.org/</a> )

# Trends - Precipitation

(a) Factual

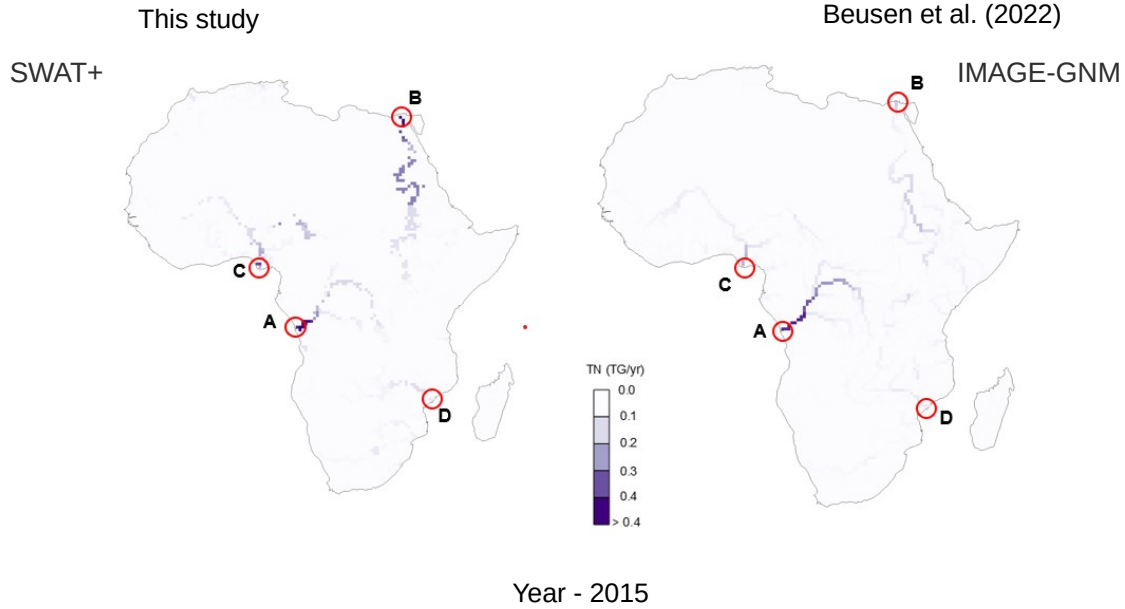

(b) Counterfactual

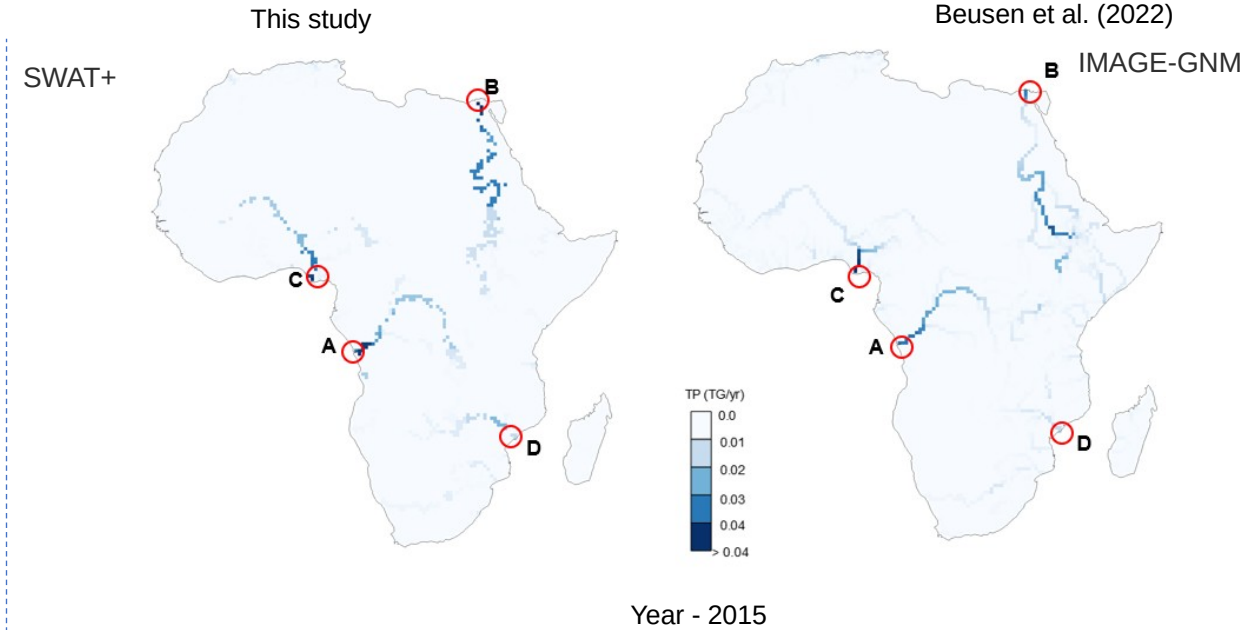

# Model setup & Evaluation

## TN river loads

River	This study (TG/yr)	Measured/Reported (TG/yr)	Source
A Congo	0.61	0.42 - 2.29	<i>Beusen et al. (2022), Mayorga et al. (2010), van Drecht et al. (2001)</i>
B Nile	0.45	0.16 - 0.99	<i>Beusen et al. (2022), van Drecht et al. (2001)</i>
C Niger	0.34	0.21	<i>Beusen et al. (2022)</i>
D Zambezi	0.1	0.08 - 0.64	<i>Beusen et al. (2022), van Drecht et al. (2001)</i>

## TP river loads

River	This study (TG/yr)	Measured/Reported (TG/yr)	Source
A Congo	0.08	0.02 – 0.25	<i>Beusen et al. (2022), Mayorga et al. (2010), van Drecht et al. (2001)</i>
B Nile	0.07	0.03	<i>Beusen et al. (2022), van Drecht et al. (2001)</i>
C Niger	0.08	0.03	<i>Beusen et al. (2022)</i>
D Zambezi	0.004	0.008	<i>Beusen et al. (2022)</i>
