

Aquamaps/AquaX project

Dr. Gabriel Reygondeau

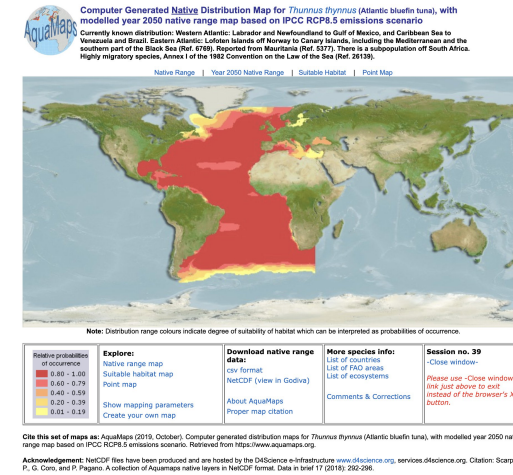

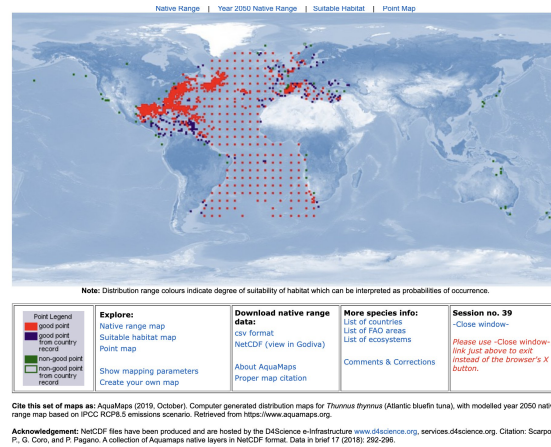

Dr. Kristin Kaschner

Dr. Kathleen Reyes

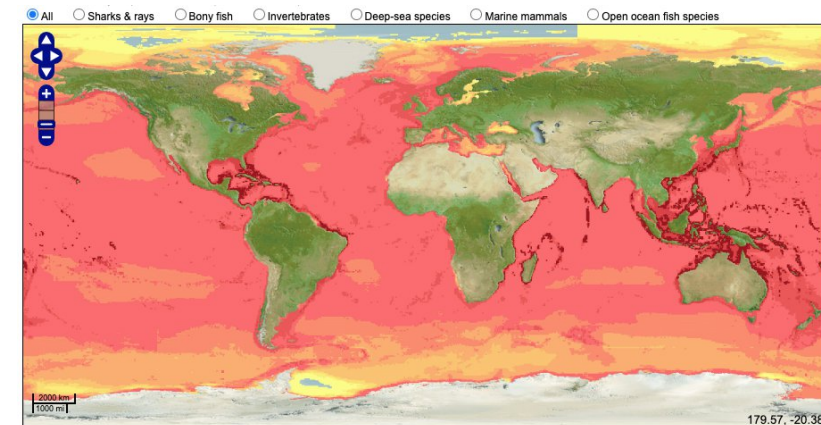

History & Goals

The environmental envelope model was initially developed in 2005 based on the RES model (Kaschner et al, 2005) aka the **trapezoidal model**

Research application fields:

- Biodiversity
- Climate change research
- Spatial planning (and marine policy)

Where are we now

- 33,518 species mapped (23,699 using rule of at least ≥ 10 good cells to generate envelope)
- A verified occurrence and metadata based
- 375 reviewed maps
- ~ 12,800 visits by 8,500 visitors/month
- 35 publications since 2014 involving core team
- Currently 800-1000 related citations / year

Changes Needed

A **clear need** for methodological changes with emphasis on :

- + Uncertainties (spatial, modelling procedure)
- + Biases on distribution (occurrence and models)
- + Quality of the model
- + Scientific development: Depth , seasonality, connectivity
- + A better Database / Approach to guide MPA managers

A new modelling approach

Philosophy “building on top of the monument built by the Aquamaps team”

Step 1: “ a more interconnected Database”

- taxonomy rests now on the **Aphia ID**
- Direct and interconnected link with OBIS, GBIF, WORMS, and soon Fishbase and Sealifebase
- 1 ID for 1 species including synonyms

A new modelling approach

Philosophy “building on top of the monument built by the Aquamaps team”

Step 1: “ a more interconnected Database”

- taxonomy rests now on the **Aphia ID**
- Direct and interconnected link with OBIS, GBIF, WORMS, and soon Fishbase and Sealifebase
- 1 ID for 1 species including synonyms

Step 2: “ Verification of occurrence and metadata”

- All occurrences are now verified either manually (Aquamaps Db) or numerically (OBIS, AquaX) based on **literature** and **geographical** test
- Expert range maps from IUCN were all integrated in the AquaX workflow:
verification of the occurrence / definition of native range
- All the metadata (habitat and biogeographical information) are reverified by the Aquamaps **team based on the literature and taxonomist expert**

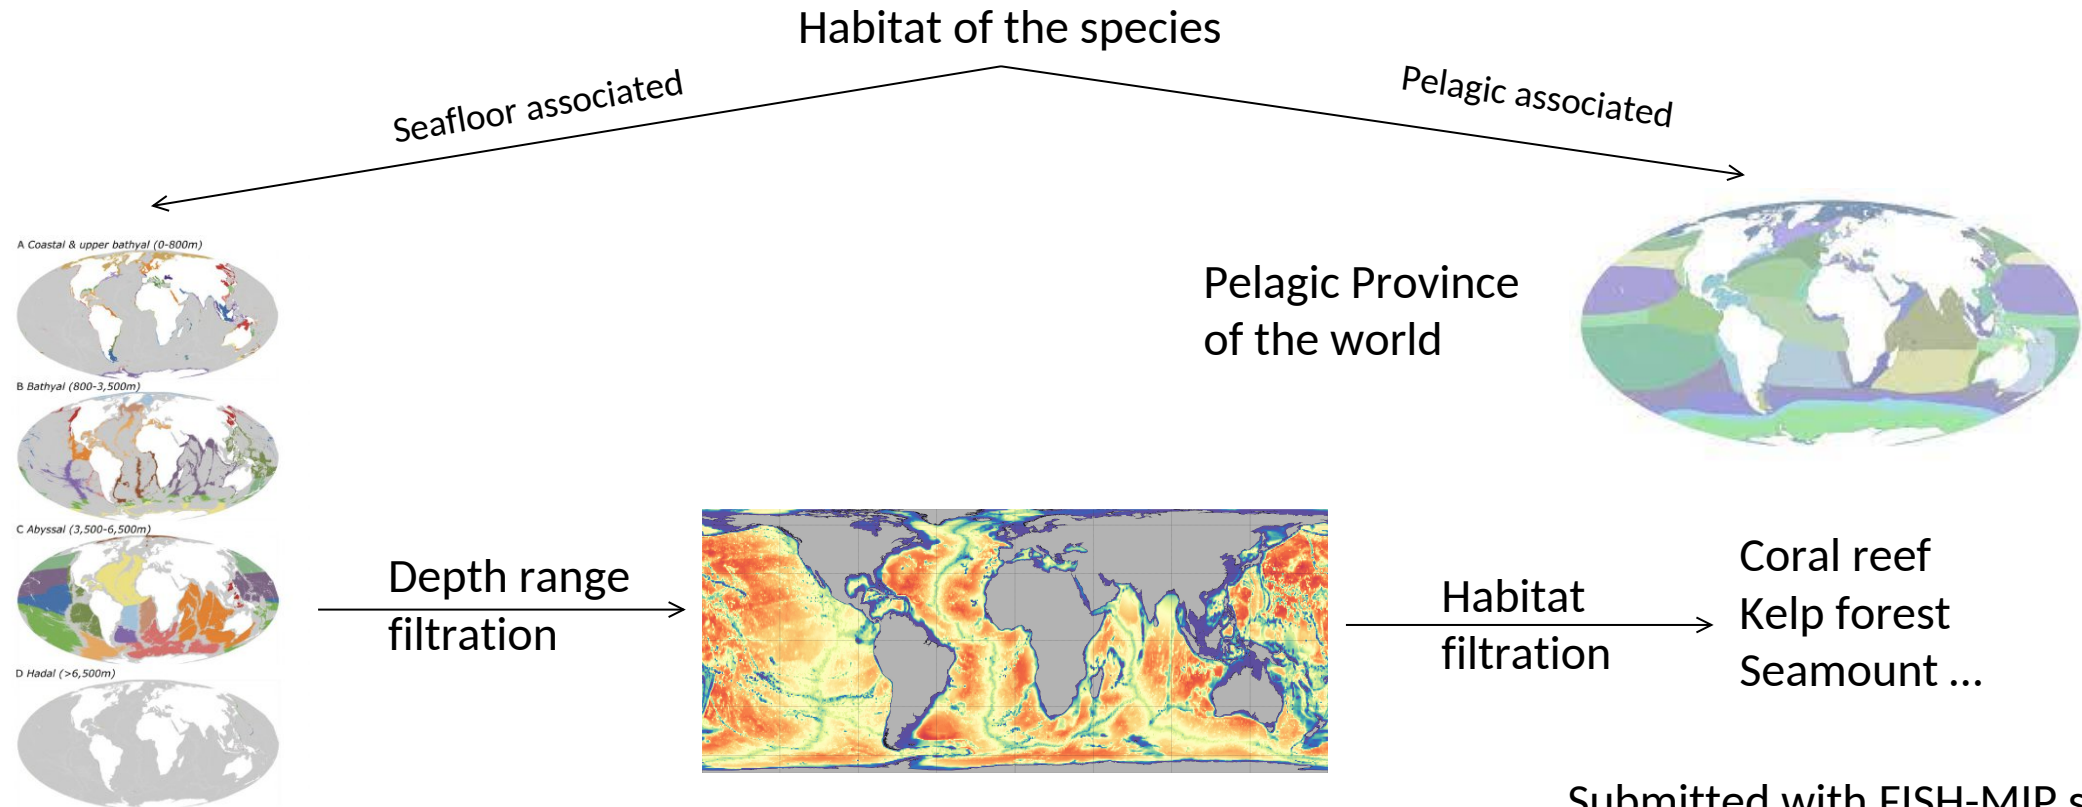

A new modelling approach

Philosophy “building on top of the monument built by the Aquamaps team”

Step 3: “ a new definition for native range and climate range ”

- If no expert range map are available
- FAO area were dropped from the AquaX workflow to respect the ecological distribution of species

Submitted with FISH-MIP special issue

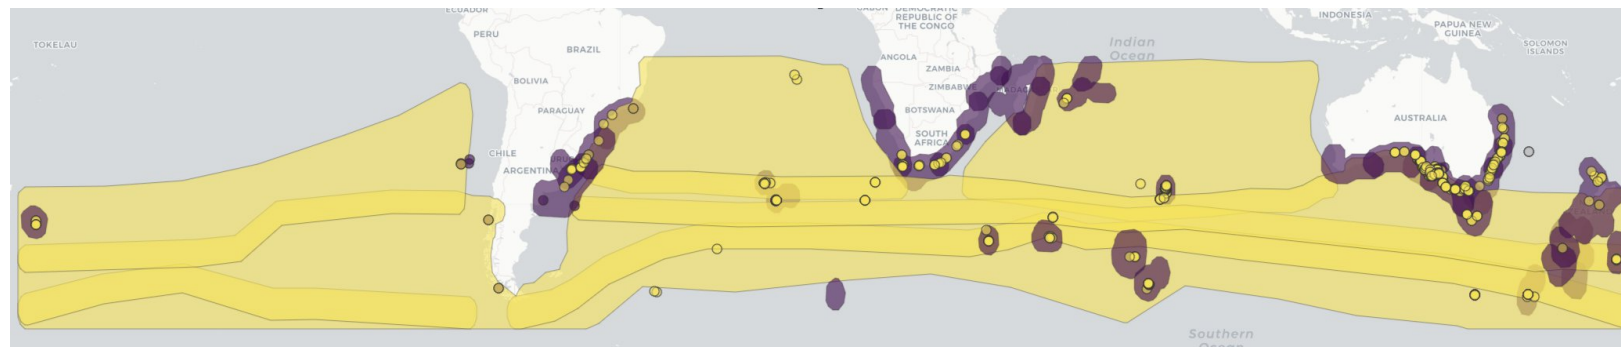

A new modelling approach

Philosophy “building on top of the monument built by the Aquamaps team”

Step 3: “ a new definition for native range and climate range ”
occurrence

Native range

Climate range is defined as all the neighbouring province where the species
Could access within the next 80 years based on climate velocity

A new modelling approach

Philosophy “building on top of the monument built by the Aquamaps team”

Step 4: “Environmental data fitted for climate change study and conservation ”

+ Selection of the variable based on the ecology of the species (Seafloor, surface)

+ Selection of set of variable based on the ecology and taxa of the species (based on expert knowledge and literature)

+ Selection of Pseudo absences based on ecology and Native range (ERM, AquaX-RM)

A new modelling approach

Philosophy “building on top of the monument built by the Aquamaps team”

Step 4: “Environmental data fitted for climate change study and conservation ”

Introducing Aqua-X Platform: Multi-Species Modelling

Improved and new analytical tools & indices:

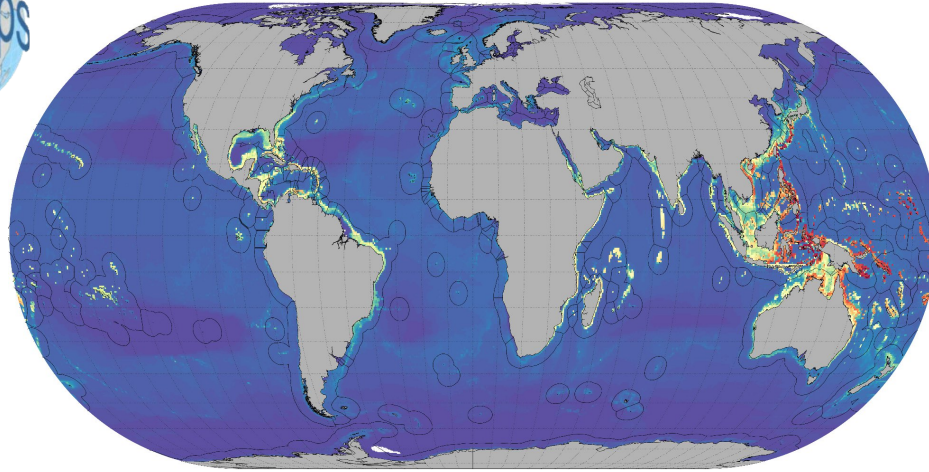

AquaX
Modeling Marine Life

- Species Richness recomputed using the 10 models agreement

Introducing Aqua-X Platform: Multi-Species Modelling

Improved and new analytical tools & indices:

AquaX
Modeling Marine Life

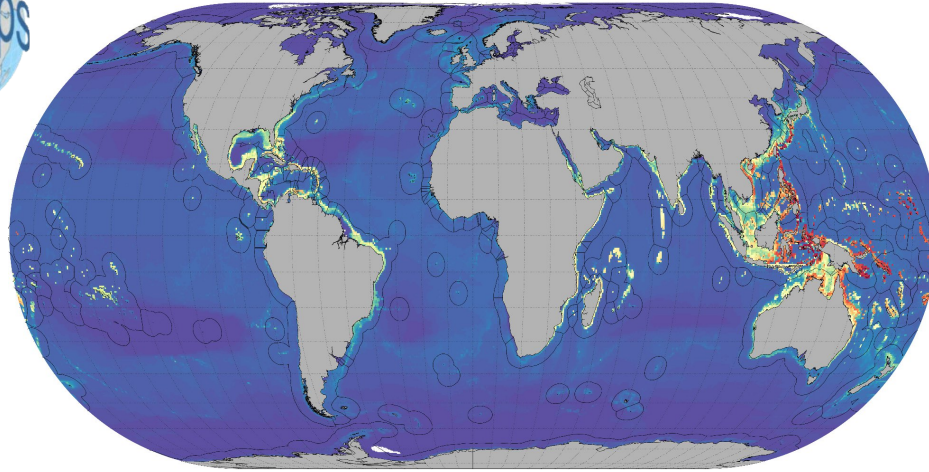

- Species Richness recomputed using the 10 models agreement
- Development of Confidence interval

Introducing Aqua-X Platform: Multi-Species Modelling

Improved and new analytical tools & indices:

AquaX
Modeling Marine Life

- Species Richness recomputed using the 10 models agreement
- Development of Confidence interval
- New indices to guide conservation and effect of climate change :
Range Rarity, Invasion, Extirpation, turn Over

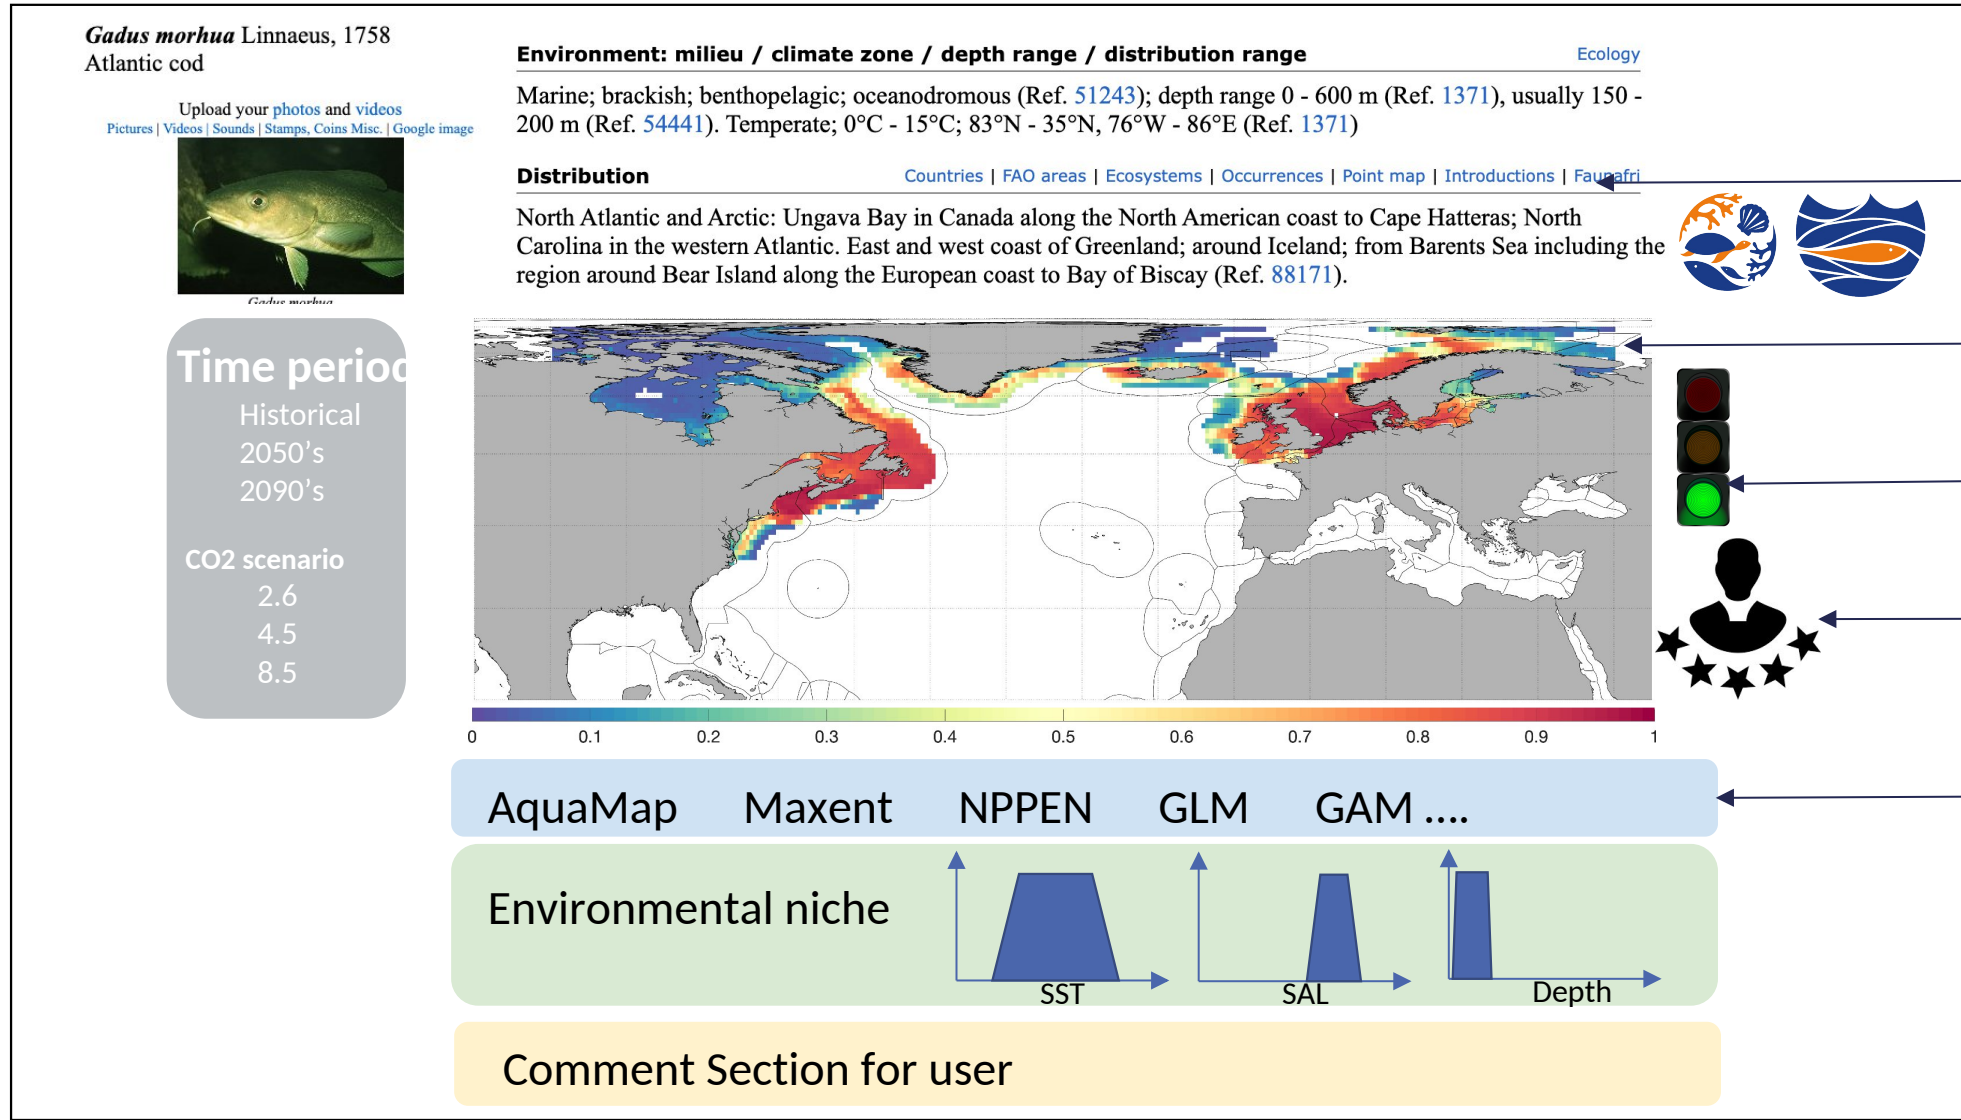

Model quality for each species

- Model development : improved distribution using expert knowledge
