CLIMATE IMPACT RESEARCH

# Can we understand the variability in flood-induced displacement using process-based global flood modelling?

## ISIMIP Workshop 2024

Sandra Zimmermann, Peter Burek, Hannes Müller Schmied, Aristeidis Koutroulis, Simon Gosling, Sian Kou-Giesbrecht, Qi Wei, Jinfeng Chang, Katja Frieler and Jacob Schewe

Potsdam Institute for Climate Impact Research (PIK)

[sandra.zimmermann@pik-potsdam.de](mailto:sandra.zimmermann@pik-potsdam.de)

# Motivation

$$\text{Risk} = \text{Flood Hazard} \times \text{Exposure} \times \text{Vulnerability}$$

inundated area

pop affected

## Model-derived

Kakinuma et al. (2020)  
Kam et al. (2021)

## Satellite Imagery

Vestby et al. (2024)  
Mester et al. (2023)  
Sauer et al. (under review)

- Projections
- Impact attribution
- Global coverage
- Comprehensive hazard information

- Observation-based
- Implicit accounting for flood protection

# How well can process-based modelled flood hazards explain...

1. whether displacement occurs?
2. how high displacement will be?

# Deriving the Hazard Components - CaMa-Flood Modeling Chain

WaterGAP2-2e Output from  
ISIMIP3a Frieler et al. (2024)

- Direct human forcing
- 20CRV3-ERA5 Reanalysis Data (1901-2021)

**CaMa-Flood**  
Yamazaki et al. (2011)

Annual Max Outflow (15x15arcmin)

**Flood Depth +  
Inundated Area**  
(1x1arcmin)

**Flood Duration**  
(15x15arcmin)

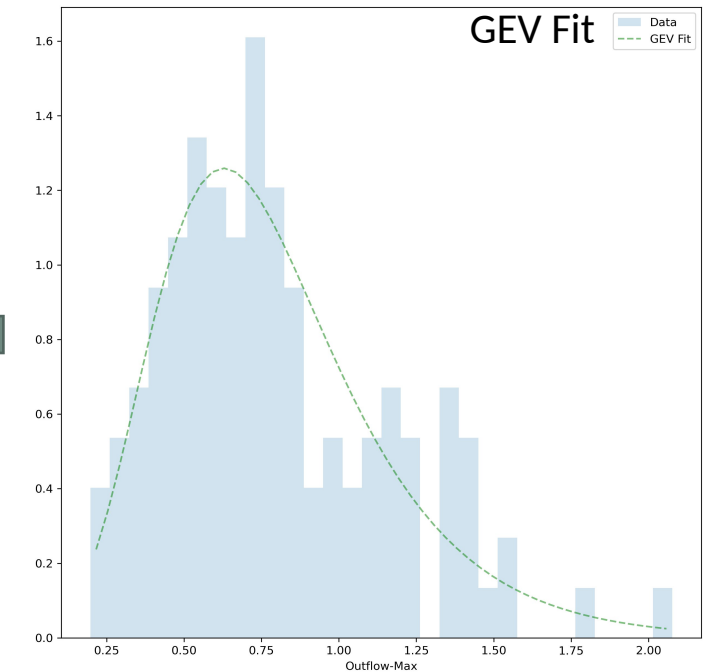

**River Velocity**  
(15x15arcmin)

No Protection (nopros)

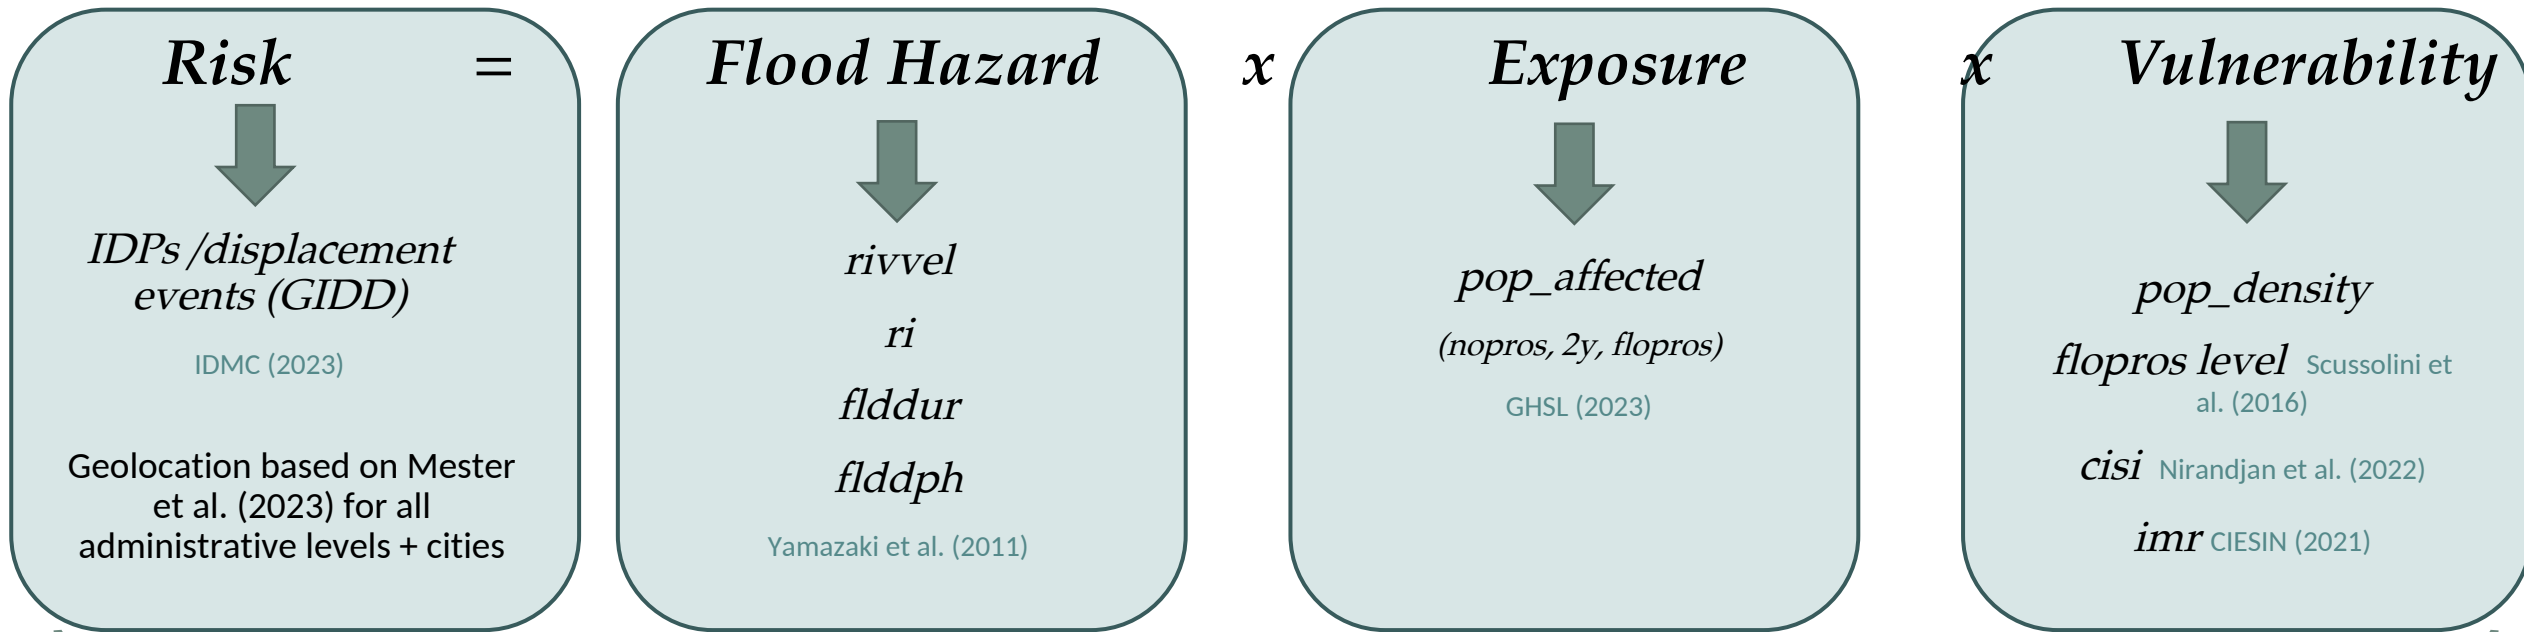

'Natural' Protection (2y)  
Willner et al. (2018)

FLOPROS (merged layer)  
Scussolini et al. (2016)

**Return Interval**  
(15x15arcmin)

# Model Set Up – Dependent and Independent Variables

Aggregated (mean/sum) on administrative levels 0,1,2 – national, province and district level and by event

GADM (2023)

**1. Logistic Regression Model:**  
displacement event

**2. Multivariate Linear Regression Model:**  
IDPs(log) displacement events (only)

# How well can different modelled flood hazards components explain...

1. whether displacement occurs?
2. how high displacement will be?

# AUROC for different administrative and protection levels

# Variable Coefficients – Level 0

*Flood depth , river velocity*

POTSDAM INSTITUTE FOR  
CLIMATE IMPACT RESEARCH

# Variable Coefficients – Level 2

*River velocity, flood duration, flood depth, return interval*

# How well can different modelled flood hazards components explain...

1. whether displacement occurs?
2. how high displacement will be?

# $R^2$ for different administrative and protection levels

# Variable Coefficients - Level 2

*River velocity, flood depth*

POTSDAM INSTITUTE FOR CLIMATE IMPACT RESEARCH

# Variable Coefficients – Level 0

*flddur, flddph*

*flddph*

# First insights and next Steps

## 1. Logistic Regression Model:

**simulated exposure adds value**  
**hazard components mainly on disaggregated levels**

**River velocity interactions**  
**High/low displacement subsets**

## 2. Multivariate Regression Model:

**Applying FLOPROS might miss evacuations /  
underestimate exposure**

**Accounting for uncertainties in FLOPROS**

# Thank you for your attention
